CS548 Isolated Channel Oscilloscope System Specification

Summary

The CS548 is an individually isolated channel high CMRR oscilloscope with four channels. We can supply the unit with fewer channels – from none to three if that is all that is required. It is designed to measure all the signals in an operating full or three phase power electronic switching bridge on both the low and high sides. Examples include gate drives to measure voltage and charge, the power switch to measure loss and parasitic stress, the output to measure power and spectrum for EMC compliance, and the control system for Gain/Phase and stability. The CS5X8 includes an isolated signal generator for stimulus, and two expansion pod connectors for isolated input and output functions. FourCS548's can be slaved to make a 16 channel oscilloscope with coherent sampling. See the selected measurements at the end of the specification section for visual examples of measurements made. Other system components compliment the CS548 Oscilloscope and are summarized.

Front

Chan A - Chan D local and remote inputs:

- 2kVDC, 1kVAC CAT II, 600VAC CAT III operating isolation voltage to ground and other channels. (Local)
- 30 kV operating isolation voltage to ground and other channels, via CS1200 Remote Probe.
- 100 dB CMRR at 50 MHz
- 14 bit resolution, 100dB dynamic range
- 200 MHz Analog BW
- 20 pF to chassis
- Two hardware ranges:
  ±0.8V with 100uV resolution
  ±8Vwith 1mV resolution
- 300uV rms noise on 0.8V range
- probe isolators for protection.

Pod 1, 2 expansion

- 5 x Bidirectional 400 Mbps LVDS channels per pod.
- **CS1301** Isolated digital input pods included.
- **Optional Pods:**
  CS1302 Isolated four digital outputs + one input.
  See also **Further Pod development**
- **Pulse Builder** for Pulse Trains, PWM, and double pulse generation.

CS1200/1/2/3 Remote Channels

- Remote fibre connected channels up to 30m from CS548.
- Voltage or Current, 2pF free space

Pulse generator/Calibration

- Probe Comp output ~ 1ns rise, fall -time, programmable 5-12V level.
- Programmable Pulse train, PWM or double pulse.
- Programmable DC Cal output for complete probe and channel DC calibration. Ref is 7.5V or 0.6818V ± 0.035%, or short to ground.

Power Button

- Push On- Push Off power button.
- Rear 2 pin connector for remote power or power at start operation.

Back

Signal Generator:

- Isolated 600VDC, 300VAC CAT II
- 0 - 65 MHz
- 14 pF to chassis
- 100 dB CMRR at 50 MHz
- Sine, square, arbitrary (incl patterns)* 100uV rms noise

Digital Port:

- 16 bi-directional pins connected to Silego SLG46826V analog/digital programmable device
- Trigger In/Out connection*

Link Port:

- Links to CS1070 0-50 MHz 1A power amplifier, CS1133VSat probe.
- Includes Uart, SPI and I2C I/O*
- Trigger and control *

SD Card:

- Store stand-alone captures to the SD Card *

USB:

- USB 3-C socket
- USB3 @ 130MBps
- USB2 @ 30 MBps

Ethernet: *

- SFP socket based
- Copper 10/100/ 1000 Mbps
- Fibre 1Gbps

Triggering

- Two FPGA mixed signal triggers
- Triggers interpolate in time for higher trigger accuracy.
- Triggers may be combined using AND/OR/XOR
- Triggers may be sequences Trigger 1 [num occurrences] - time specification - Trigger 2 [num occurrences] . The time specification is less than a period, in a period range or more than a period. Triggers may be completely independent.
- The digital portion may be rising or falling digital input, conditional on one or more other digital inputs being 0, 1 or don't care. Bit's may be OR'd or AND'd.
- The analog trigger may be conditional on a digital state.

Power In:

- 10- 24V DC, 43W.
- Can be car power supply connected, withstands crank and load dump.

Link In/Out:

- Used to daisy chain multiple units
- Synchronous sample clock
- Trigger and control

CS548 Included Components

The CS548 includes 1 off 1x/10x probe, 100x probe and Common Mode Choke per installed channel, 2 off CS1301 Input Pods, USB Cable, Power Supply, SMA-BNC adaptor, Ethernet SFP module (copper or fibre).

* Item still to be implemented. See Specification Status section.

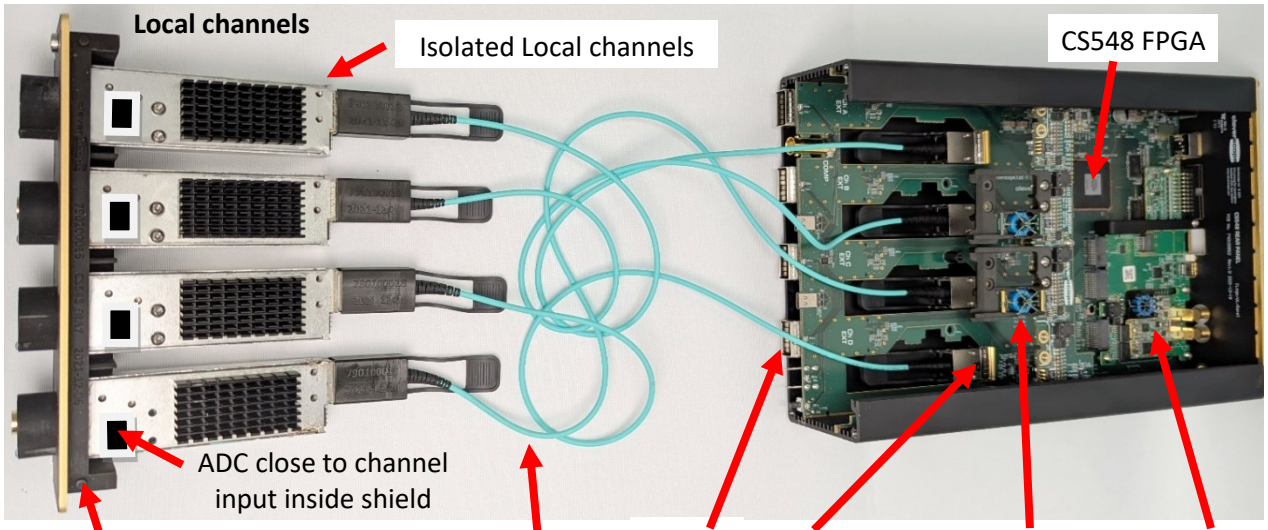
CS548 Channel Isolation

The CS548 can have either **local** or **remote** channels connected via QSFP Fiber cables. Local channels plug into the local QSFP sockets inside the CS548. Remote channels are plugged into the remote channel QSFP sockets on the front panel. All Channels use a 14 bit ADC in the front end to convert the analog signal and send it digitally via the QSFP fiber cable to the CS548 FPGA. This optimizes noise, offset, gain and linearity specifications.

The CS548 local channels are held in a plastic insulator tray to maximize creepage and clearance. The tray has a CTI>600, and conforms to Materials Group 1 in the IEC61010-2 standard. We build for use in Pollution Degree 2 environments. The CS548 is for use with up to 600VAC Category III circuits (permanently connected to the mains switchboard via a fuse).

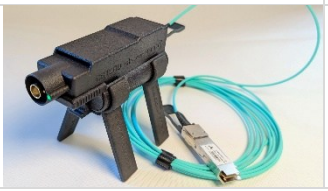
Each shielded local channel is completely separate and attached to the channel power board using a spacer for high CMRR and isolation. The plastic / transformer former (CTI >600) provide a creepage >22mm and clearance > 18mm. The low capacitance transformers use triple insulated Rubadue wire (T32A01T5XX-1.5). The Digital QSFP Fiber cables to the Main board (500mm) has a breakdown voltage >30kV. Each channel is isolated from the chassis and other channels using high dielectric Formex GK-10 (16kV BV, 600V CTI) plastic sheets.

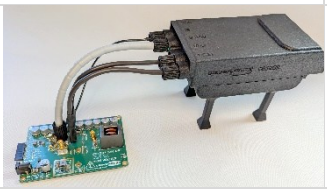
Exploded view of CS548 Channels



Isolated Remote channels

CS1200 Remote Voltage Channel	CS1201 Remote Current Channel	CS1202 Remote Quad Channel	CS1203 Remote 10kV Channel
			





We have built the CS548 with the assumption that the UUT is powered by a line to neutral mains voltage <600Vac, and includes secondary circuit working voltages of <2240 VDC or ACpk. This is measurement category III. These standards apply:

Clearance:

- IEC61010-1 (ed 3.0) Table K.11, Reinforced = 2 x 6.9mm = 13.8mm
- IEC61010-2-030 Ed 1.0 (Test Equipment), Table K.101, a reinforced insulation clearance: 10.5 mm.

We use 18mm.

Creepage:

IEC61010-1 (ed 3.0) Table K.13, 2000Vdc, Reinforced = 2 x 10mm = 20mm.
We use 22mm.

Warnings

The Isolated Analog Inputs **CHAN A..D** and **SIG GEN** outputs may have high common voltages applied to the coaxial connectors.

Do NOT touch any connectors, probes or Channels connected to the Channels or Sig Gen during high voltage operation. Ensure all connected voltage sources are turned off before changing any connector. Verify this using a multimeter.

The **CHAN A..D** inputs are rated at a maximum of 2kV DC common mode to real earth, and 1kV signal to BNC common. **Do NOT exceed these values**.

The **SIG GEN** output is rated at 300VAC CAT II or 600VDC between the coaxial connector common and real earth. **Do NOT exceed this value**.

Do NOT allow liquids to enter the CS548.

Do NOT block the CS548 ventilation holes, including placing the CS548 upside down.

Do NOT exceed an input supply voltage of 30VDC.Only power by an external limited energy source (LPS or Class2 power supply), such as the mains power adaptor supplied with the unit.

Do NOT lick.

If the CS548 equipment is used in a manner not specified by Cleverscope, the protection provided by the equipment may be impaired. For example, safety will be impaired if exposed metal connectors are used.

If cleaning the CS548, use only a damp cloth to wipe down any surfaces. Do NOT use IPA or alcohol based products.

Certifications

The CS548 has been tested to, and certified toCE and CSA standards:

EMC:

- EN IEC 61326-1: 2021(*): “Electrical equipment for measurement, control and laboratory use - EMC requirements - Part 1: General requirements”
- EN 55011:2016 + A1:2017 + A11:2020 + A2:2021: "Industrial, scientific and medical equipment. Radio-frequency disturbance characteristics. Limits and methods of measurement."
- EN 61000-4-2:2009: "Electromagnetic compatibility (EMC) - Part 4-2: Testing and measurement techniques - Electrostatic discharge immunity test."
- EN IEC 61000-4-3:2020: "Electromagnetic compatibility (EMC)- Part 4-3: Testing and measurement techniques- Radiated, radio-frequency, electromagnetic field immunity test."
- EN 61000-4-4:2012: "Electromagnetic compatibility (EMC) - Part 4-4: Testing and measurement techniques - Electrical fast transient/burst immunity test."
- EN 61000-4-5:2014+A1:2017: "Electromagnetic compatibility (EMC) - Part 4-5: Testing and measurement techniques - Surge immunity test."
- EN 61000-4-6:2014: "Electromagnetic compatibility (EMC) - Part 4-6: Testing and measurement techniques - Immunity to conducted disturbances, induced by radio-frequency fields."
- EN 61000-4-8:2010: "Electromagnetic compatibility (EMC) - Part 4-8: Testing and measurement techniques - Power frequency magnetic field immunity test."
- EN IEC 61000-4-11:2020 + AC:2020-06 + AC:2022-10: "Electromagnetic compatibility (EMC) - Part 4-11: Testing and measurement techniques - Voltage dips, short interruptions and voltage variations immunity tests."

Safety:

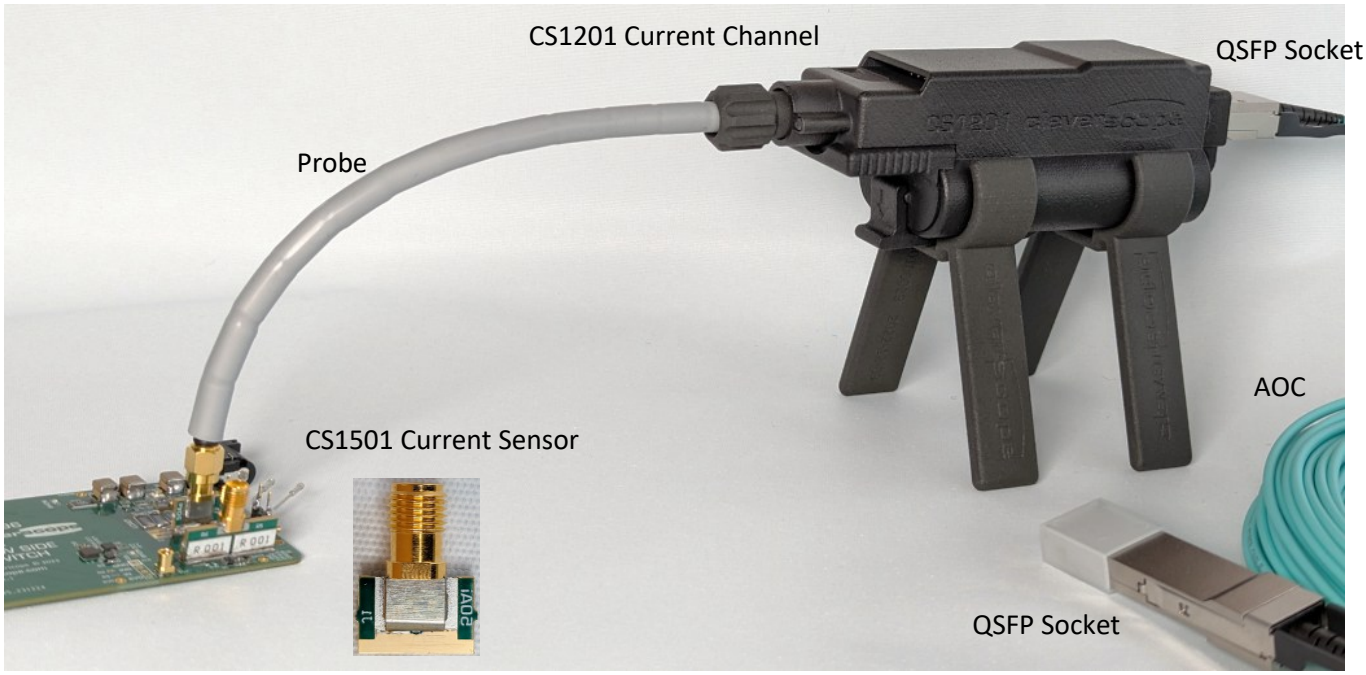
- IEC 61010-2-030:2021 +Aii:2021 Particular requirements for T+M equipment

System Accessory Probes and Remote Channels

CS1200 Remote Voltage Channel, CS1201 Remote Current Channel

The CS1200 remote Voltage Channel (VC) and the CS1201 remote Current Channel (CC) are used with the CS548 to make measurements in a safety cage, or further away from the CS548. Each uses a standard QSFP fiber cable to connect the CS1200/1201 to the QSFP remote sockets on the CS548 front Panel. The CS1200 input specification is identical to the CS548 internal channels, while the CS1201 is designed to use the CS1501 1mΩ shunt sensor. The CS1200/CS1201 are an optional purchase.



CS1200 Voltage Channel (VC)

- 30kV isolation provided >150mm spacing between Channel and other structures.
- Pod enclosure isolation to BNC > 1kV
- 2 pF free space capacitance >50 mm above reference plane
- 100 dB CMRR at 50 MHz
- 14 bit resolution, 100dB dynamic range
- 200 MHz Analog BW
- Two hardware ranges:
  ±0.8V with 100uV resolution
  ±8Vwith 1mV resolution
- 1 M Ohm // 21 pF input impedance

CS1201 Current Channel (CC)

- 30kV isolation provided >150mm spacing between Channel and other structures.
- Pod enclosure isolation to BNC > 1kV
- 2 pF free space capacitance >50 mm above reference plane
- 140 dB CMRR at 50 MHz
- 14 bit resolution, 100dB dynamic range
- 200 MHz Analog BW
- Two hardware ranges:
  ±63A with 63mA resolution continuous square wave
  ±630A with 630mA resolution DPT only
- 2 Ohm compensated input impedance

The CS1200/CS1201 allow time aligned measurements to be made between locations up to 60m apart (using 30m cables), and measurements in hazardous, high voltage situations. The VC and CC batteries are standard 21700 5AHr cells, and offer more than 6 hours operation before recharge. One set of cells can be recharged while the other set is being used. Cleverscope supplies two sets of batteries, and a charger.

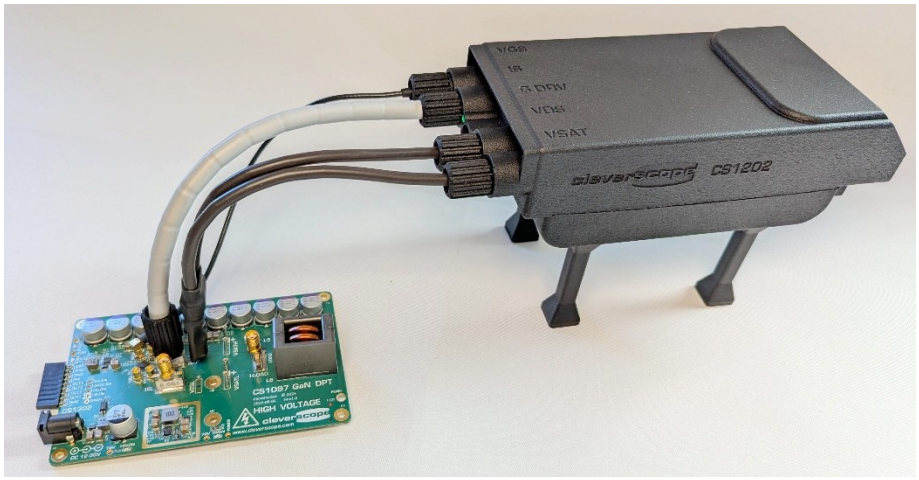
It is assumed that the CS1200 will be used with the standard oscilloscope probes supplied with the CS548. However, short attenuating probe tips are available. These allow operation in high common mode slew applications with a minimum of common mode artifacts. The CS1201 is supplied with a 200mm probe cable and CS1501 1mΩ shunt sensor.

The standard Active Optical Cable length is 3m. Lengths of 5, 10, 20 and 30m are available on request.

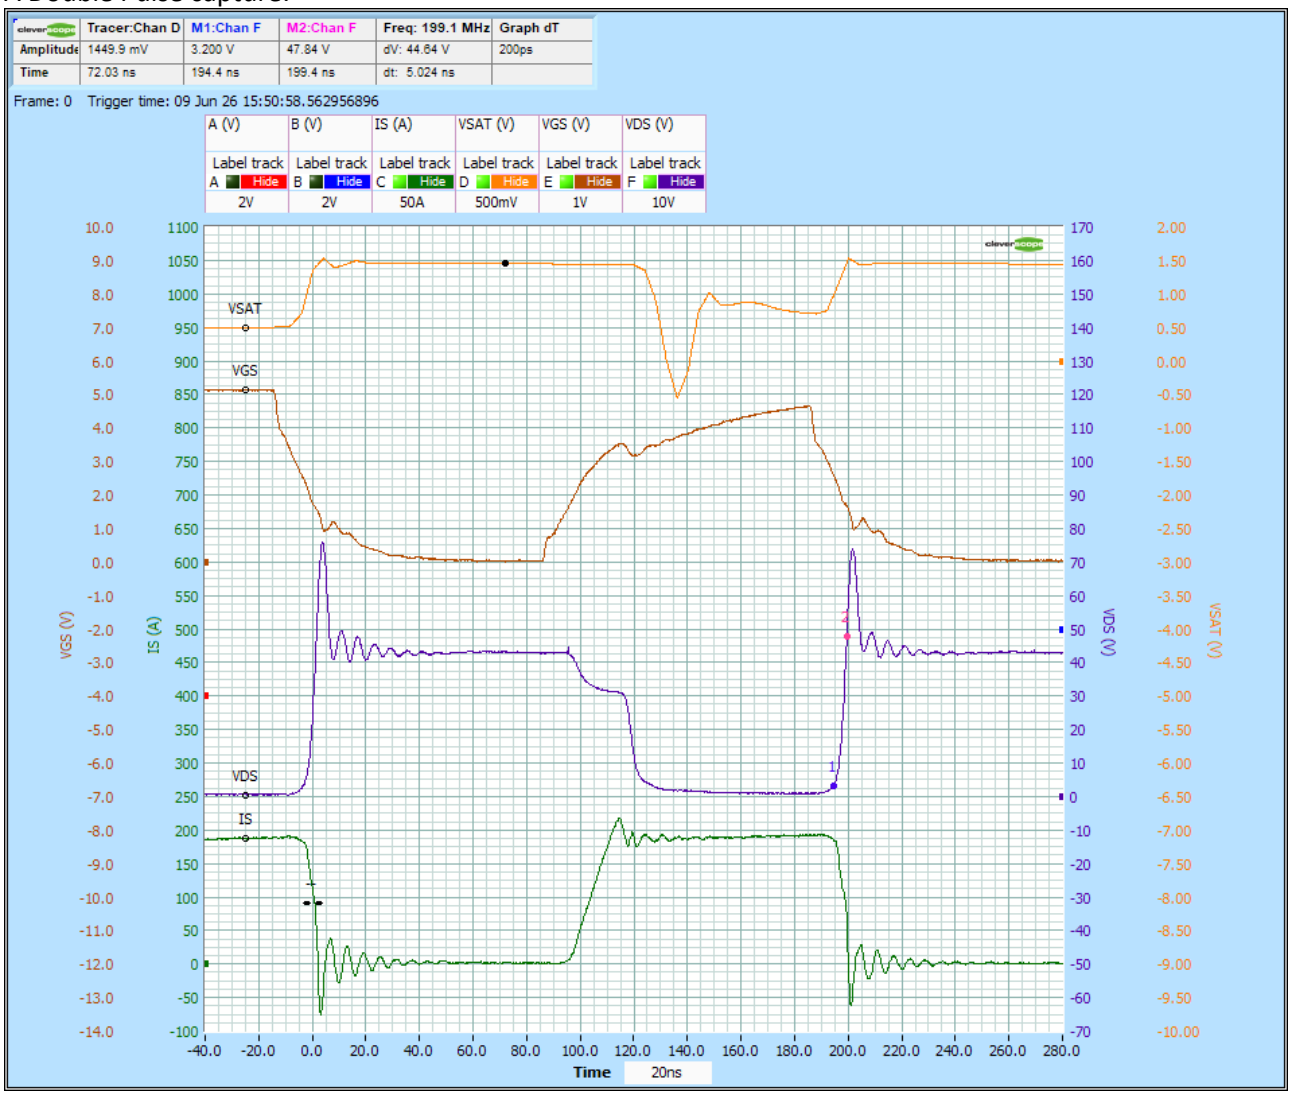
CS1202 Remote Quad Channel

The CS1202 remote quad channel captures VDS, VGS, VON and IS all in one go. It maintains a 400ns duration 5GSPS ring buffer which can be halted, transferred and automatically combined with the standard samples following a post trigger period. Otherwise it samples at 250 MSPS. Resolution is 14 bits. BW is 950 MHz. Inputs are:

- VDS ±1V, with a probe tip for range
- VGS ±1V, with a probe tip for range
- VON three clip levels of 0.75V, 1.5V and 15V
- IS two ranges of ±63A and ±630A using the CS1301 1mΩ shunt sensor.

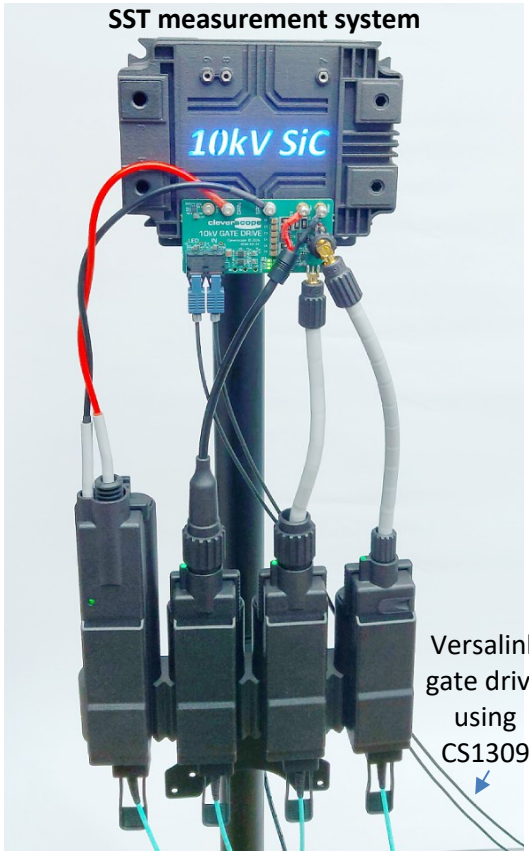


A Double Pulse capture:



CS1203 Remote 10kV Channel

The CS1203 remote 10kV channel is used to measure V_{DS} with an amplitude range of 0-10kV. As it is fiber isolated, the common mode voltage is determined by the creepage and clearance of the support. The supplied supports have a CTI>600, a creepage of 80mm when placed as shown below, and are rated for 20kV DC (Pollution Degree 2).



V_{DS}: CS1203 10kV Channel	$V_{HS\ PSU}$: CS1200 Voltage Channel	V_{GS}: CS1200 Voltage Channel	I_S: CS1201 Current Channel

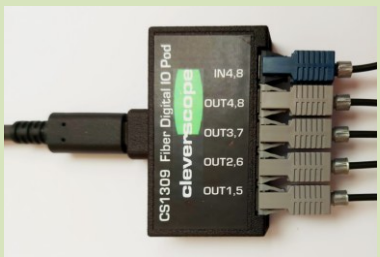
CS1203 10kV Channel (10kVD)

The CS1203 10kV Channel can measure 10kV voltage swings. The CS1203 specs:

- 200 MHz Bandwidth
- ±1kV, ±10kV ranges
- 125mV, 1.25V resolution
- 375mV, 3.75 rms noise
- >100 dB CMRR @ 50 MHz
- 200 MHz BW
- High voltage silicone insulated wire connection

Solid State Transformer (SST) Measurement.

The CS1203 is the basis of the Cleverscope SST measurement system. The CS1204 VON Channel is in development, and will measure the transistor V_{ON} voltage, while it swings up to 10kV. Both channels are fiber isolated and can be used on the high side. The existing CS1200 Voltage Channel, and CS1201 Current Channel complete the SST Portfolio - Switch and Conduction loss, RDSON, Bus Inductance, and device parameters can all be measured.



CS1309 Fiber Digital IO Pod

The CS1309 4 Out, 1 In Versatile Link (VL) Fiber driver uses industry standard 1mm plastic fiber to drive Gate or Input VL sockets. The Input may be used for signalling and status. Use Pulse Builder to generate the gate signals.

CS1133 V_{SAT}Probe

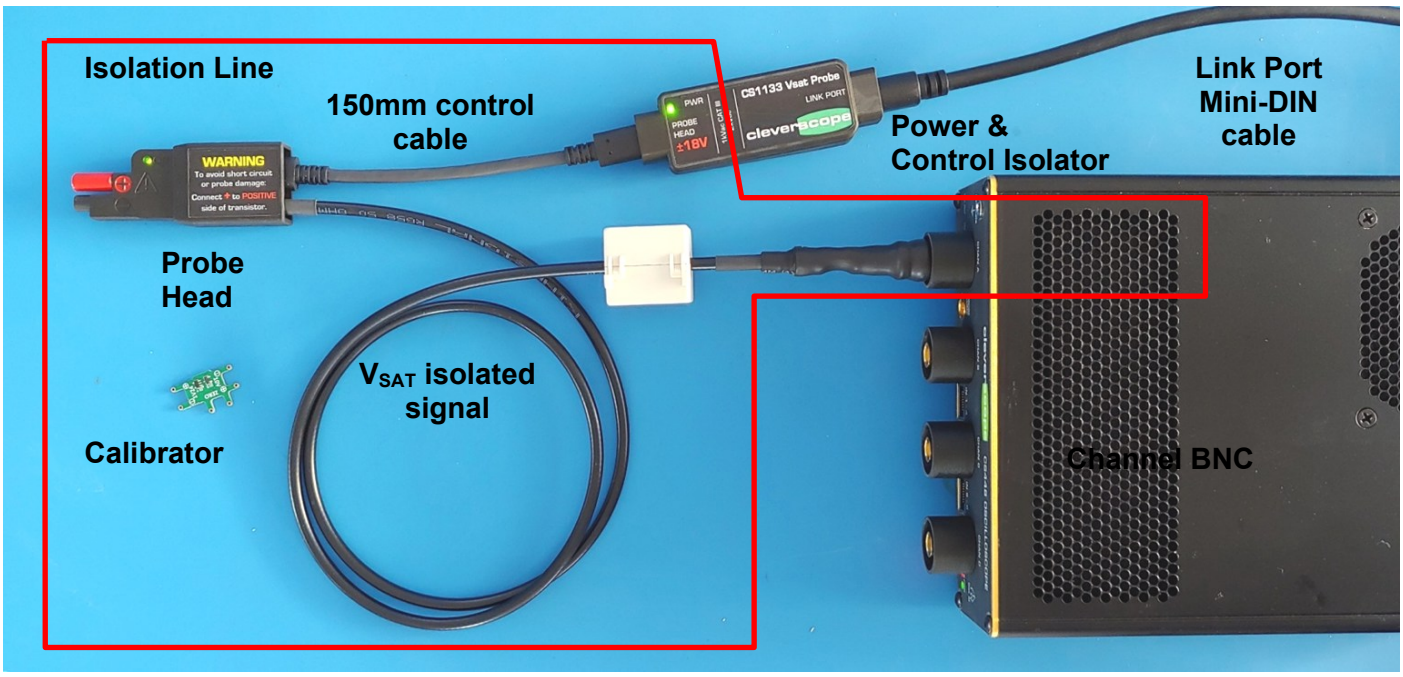
The CS1133 **VSAT probe** is used to measure the saturation voltage of a switching transistor. It uses a 30mA high compliance current source to measure the transistor forward voltage while the voltage across the device is less than the clip level. The clip level can be set to 3 ranges; approximately 15V, 1.5V and 150mV. Above the clip level the VSAT probe is disconnected from the Unit Under Test (UUT). It is expected that the UUT will have a good deal more than 30mA flowing through it so this small additional current will not significantly change the saturation voltage. The CS1133 is designed to work into a 50 ohm load. The CS1133 is rated for operation over the input voltage range of 0V to +3.3kV. It can also withstand negative overshoot on the UUT down to -100V for short term transients.

The CS1133 is powered by +5V sourced by the CS548 LINK PORT (pin 1) and 0V (pin 2) via an 8 pin Mini Din Connector. It also includes two controls to select clip level; IN1 (pin 8) & IN2 (pin 5). The power and control signals are isolated via a low capacitance isolated power supply and optical isolators housed in a separate unit. The maximum working isolation voltage is 1kVAC CAT III or 2kVDC. In addition, the active portion of the CS1133 is shielded to ensure it can be used to measure the high side transistor while it is switching.

The CS1133 is an optional purchase.

System Isolation

When used with the input channel isolation of the CS548 the CS1133 can be used to measure V_{SAT} of a high side or floating transistor. This diagram shows where the isolation occurs



All items within the isolation line (Channel A, Probe Head, Coax cable and output of Isolator) have a common reference connection which will be connected to the UUT Source (or Emitter). If the Source is a high side transistor in a half bridge this whole isolation island will move with the switching edges of the half bridge. A common mode choke (as supplied with the CS548) may be required on the coax cable to suppress common mode induced LC ringing between the coax outer inductance and the measurement point capacitance.

CS1133 V_{SAT} Probe

- +3.3kV maximum VDS
- 50 ns recovery time (1kV falling edge)
- 2kV DC working isolation voltage (1kV AC CAT III)
- Clip Levels: 15V, 1.5V and 150mV
- Gain Accuracy <± 1%
- Use application to calibrate

CS1300 Series Pods

The CS1300 Pods are used to extend the capability of the CS548 oscilloscope. Two Pod connectors are provided on the CS548. Pods use LVDS communications capable of 400 Mbps for good noise immunity, low EMI, and reliability. These pods are available now:

1. **CS1301 Isolated digital inputs.**
   Two CS1301 pods are included with the CS548.
   The pod supports 4 isolated digital inputs with one common, and fixed voltage threshold of Vhi>2.3V, with +18, -15V overload protection.

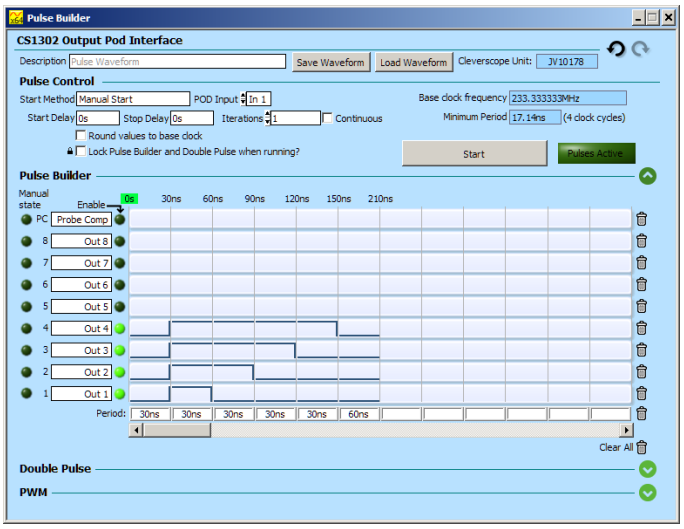
   Isolation is 600V RMS Cat III (UL), or 800 DC (VDE), based on an ISOW7844FDWE, and PCB creepage. Common mode rejection is 100V/ns.

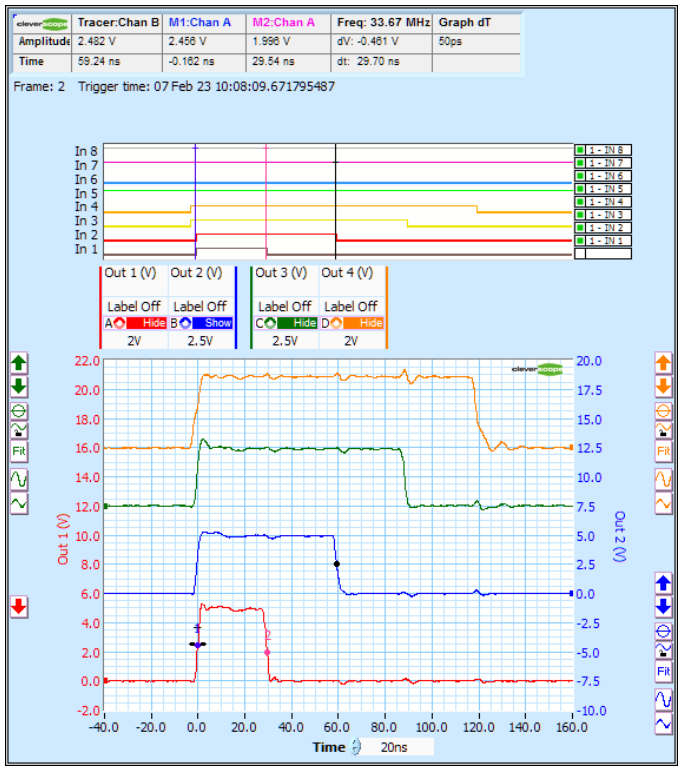
2. **CS1302 or CS1312 Isolated digital outputs.**
   The CS1302/12 is an optional purchase.
   The pod has 1 input, and 4 outputs, one of which may be assigned as a high speed clock. The pod allows high speed generation of arbitrary signals, optionally synched to the clock, with simultaneously recording of the input signal. It may also be used as a fast isolated SPI or UART port. The application supports arbitrary pulse generation, PWM, and double pulse testing using the CS1302. The CS1312 is a low jitter version of the CS1302. The output level is 5V (V_{SEL} open), or 3V3 (V_{SEL} pulled low).

   Isolation is 600V RMS Cat III (UL), or 800 DC (VDE), based on an ISO7840DW and ISOW7744DFMR, and PCB creepage. Common mode rejection is 100V/ns.

Pulse Builder

The CS1302 is supported by Pulse Builder in the Cleverscope4 application. Pulse Builder can be used to draw pulse trains, Double Pulse Test pulses, and PWM output with arbitrary durations between each edge:



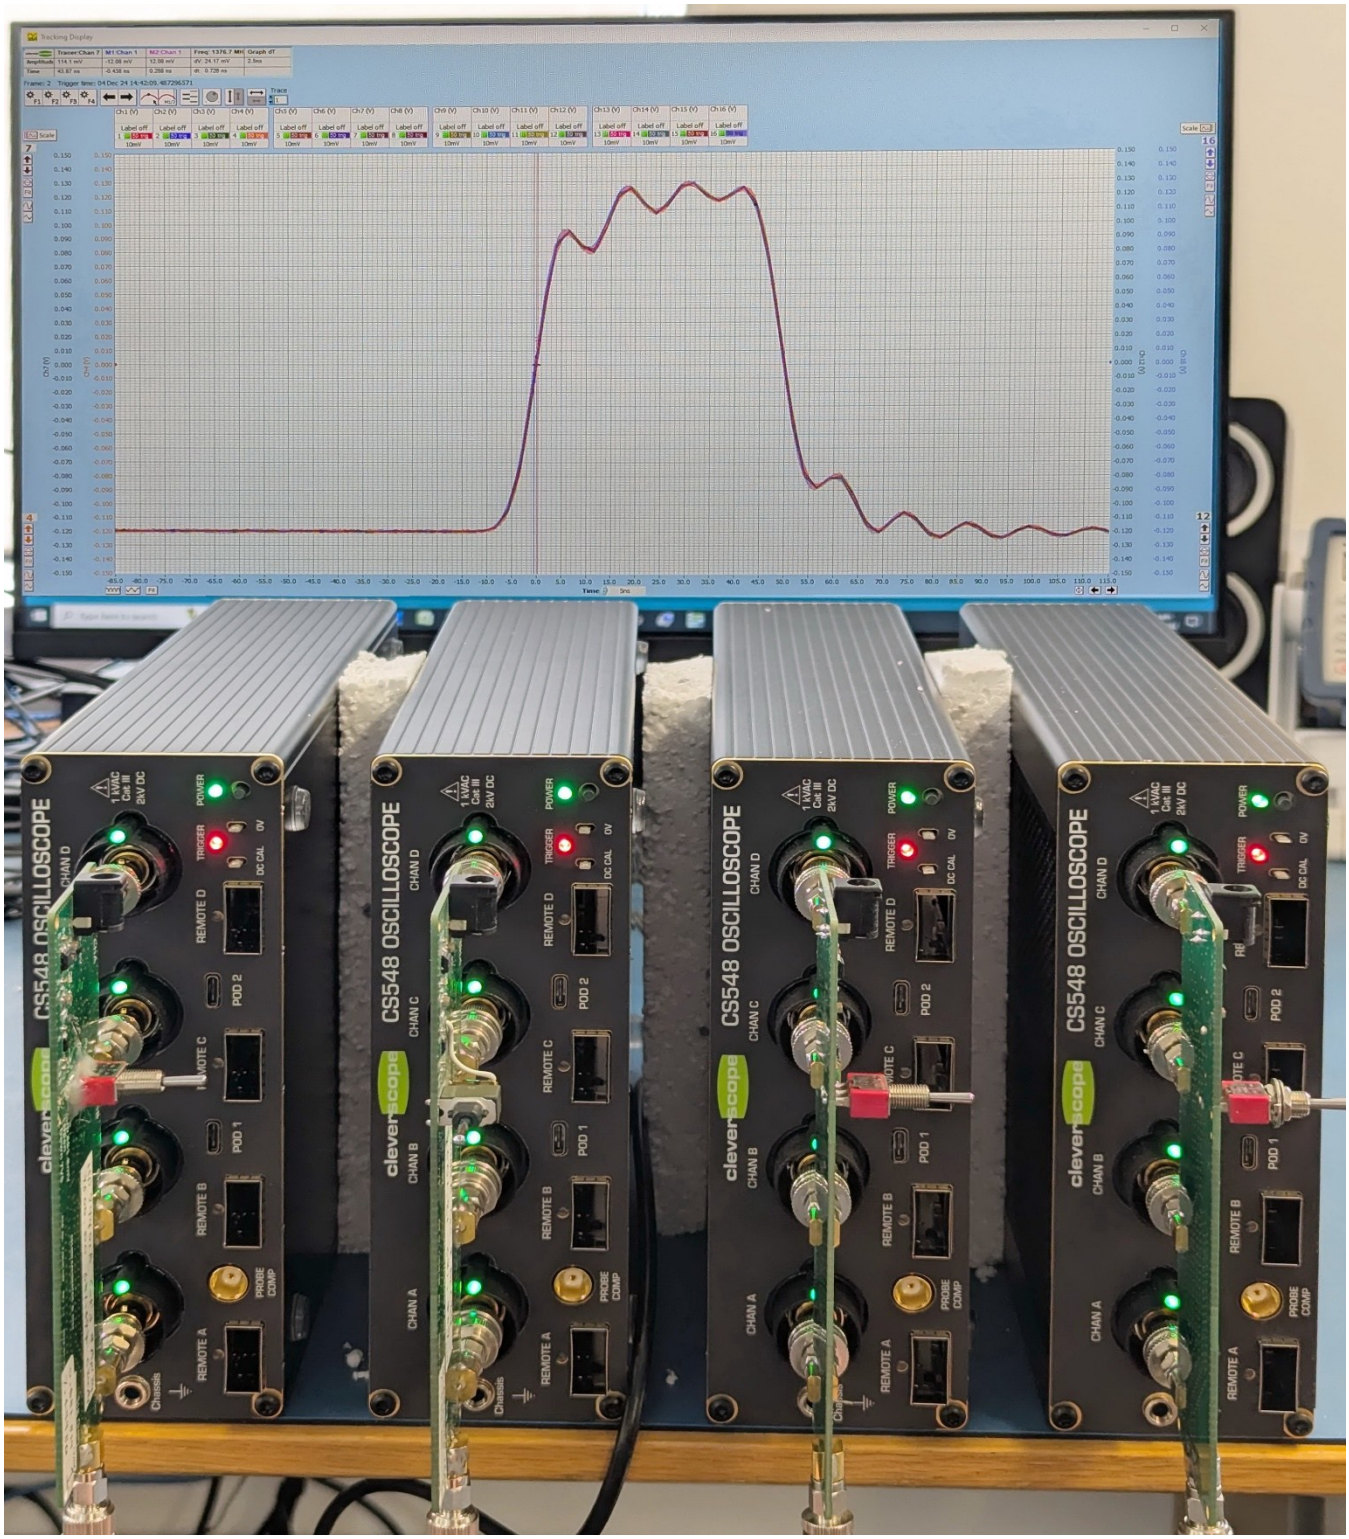


Here 4 pulses have been defined, and output via a CS1302. Outputs 1-3 are mirrored as Inputs 1-3. Input 4, which is a CS1302 input, is physically measuring Output 4. Pulses as short as 13.3ns can be generated using the CS1302, with a resolution of 3.32ns. These pulses are 30, 60, 90 and 120ns long.

Multi Unit Capture

Up to 4 units may be connected using the Link cables from a unit Link Out port to the next unit Link In port. Clock, trigger and control are shared via the link cables. Time alignment and amplitude matching are good. All 4 units perform as one 16 channel oscilloscope using the Cleverscope PC application.

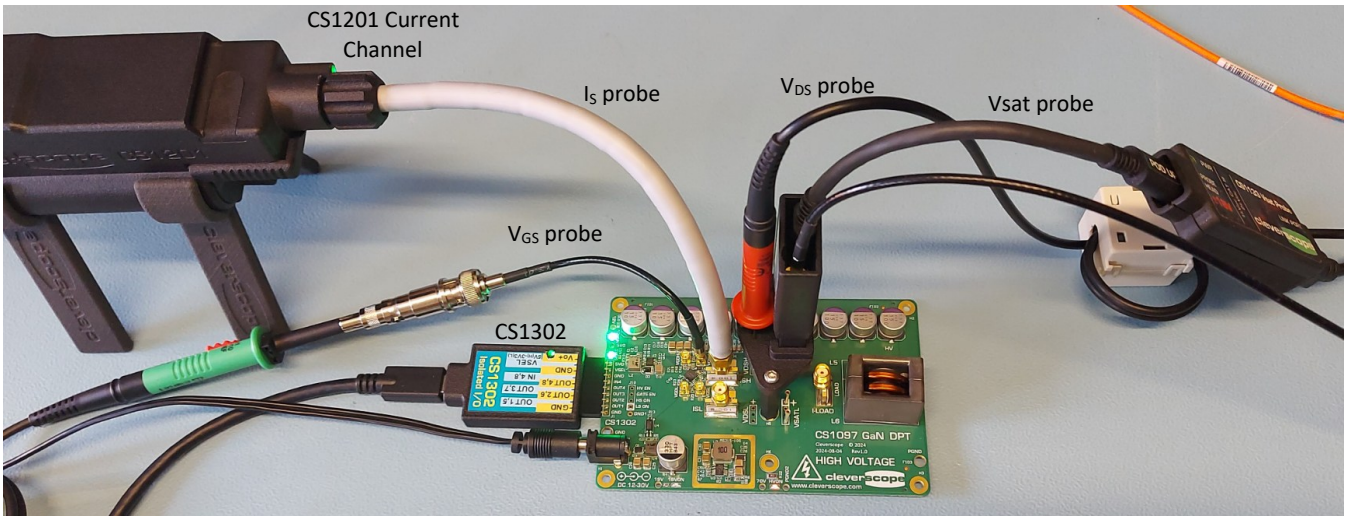
Here an unterminated 50ns pulse is displayed on all 16 channels using a 16 way time aligned signal splitter sourced from one unit's signal generator. The time axis is 5ns/div. Dispersion of about 700 ps is displayed between the two maker lines.

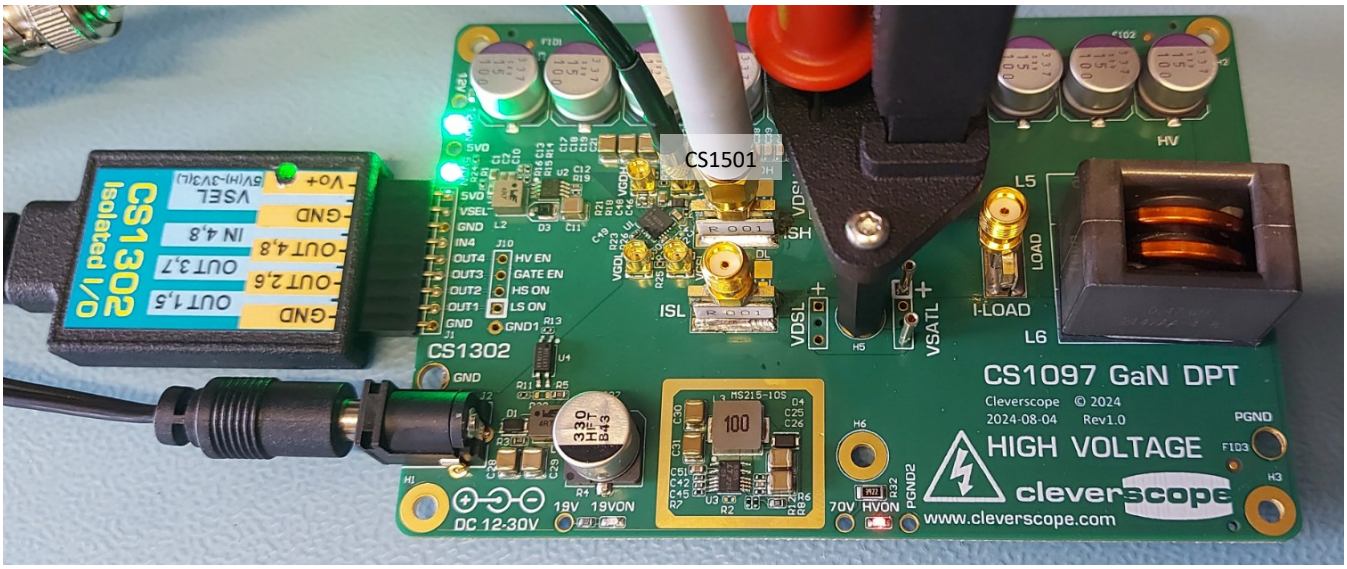


CS1097GaN Half Bridge Double Pulse Test Board

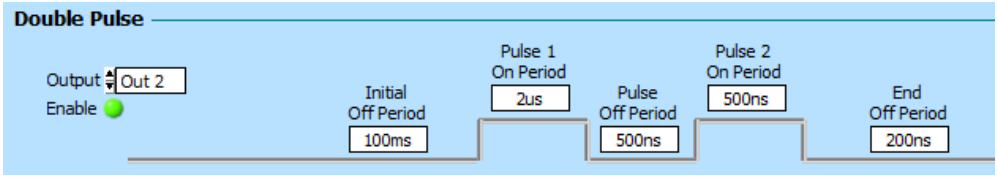
Cleverscope has developed this board for demonstrating typical measurements on Power Transistors in a Half Bridge configuration. A Double Pulse Tests (DPT) can be performed using the **CS1302 Isolated Digital IO Pod** to drive gate signals and control power enables. Measurements of the DPT can be made with the **CS548**, **CS1133** and **CS1200/CS1201** to determine Switching and Conduction losses and other switching parameters.A load inductor can be referred to either the top or bottom transistor.

The CS1302 I/O Pod and 19VDC plug into left. There is a 19V-40V booster to power the half bridge. GaNFets pulse rated at 100V 408A are used. Here are the connections for a typical test setup; a **CS1302**4 Out/1 In Pod driving gate signals, a **x10 Probe** (green) connected to MMCX connector on the top transistor **V_{GS}**, a **CS1201**Current Channel connected to **CS1501** 1mOhm shunt on the top transistor Source measuring **I_S**, a **V_{DS}x100 Probe** (red) and **CS1133 Vsat Probe** on top transistor **Vds**. Load inductor on right is 470nH.





The **'Pulse Builder'** interface is used to set up gate timing and control the enable signals. OUT1 = Low Side Gate, OUT2 = High Side Gate, OUT3 = Gate Driver Enable, OUT4 = 70V Enable. DPT is performed on top transistor so OUT2 timings are 100ms OFF (DPT repetition at 10Hz), 2us ON (current ramp), 500ns OFF, 500ns ON.
With 2us ramp time current should be I = V.dt/L = 40V*2us/470nH = 180A.



Here the **'Maths Display'** is showing 4 measured waveforms; **Vgs**, **Is**, **Vds** and **Vsat**. All are on the **High Side FET**. After the 2us ramp time the current has reached 180A and saturation voltage is 849mV.

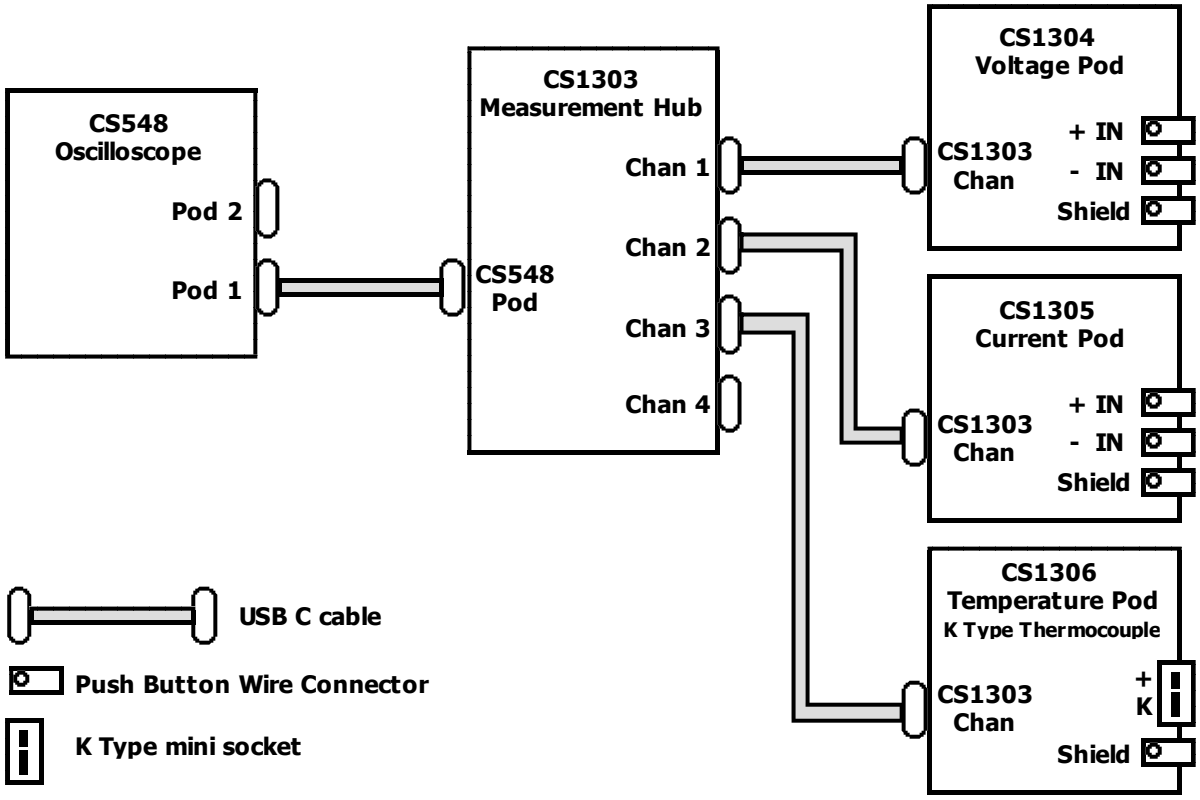
Maths Calculations:

- **Pcond** = **Is***Vsat** and reaches 256W.
- **Econd**= ∫**Pcond** reaches 39.2uJ.
- **Rds-on** = **Vsat**/**Is**= 2.7mOhms (see Tracer).
- **Psw** = **Vds***Is** has turn ON peak of 5.09kW.
- **Esw**= ∫**Psw** integrated and is 55.35uJ (delta Marker 1-2).
- **Ipeak = 153A**

Note the oscillations on Vds and Is – these are caused by the GaN Fet output capacitance (about 950pF) resonating with the loop power loop inductance (about 0.9 nH).

Further Pod Development

Cleverscope plans three new measurement pods with 1700V DC working isolation voltage, 90V/ns common mode voltage slew rate, 80 ksps capture rate, 16 bit resolution and 14 bit ENOB:



1. **CS1303 Measurement Hub**
   This pod allows connection and identification of up to four CS1304-CS1306 measurement pods to a single CS548 Pod connector.
   a. **CS1304Isolated Current Measurement**
      This pod usesa TI AMC3306M05 with ±50mV input range, to provide an isolated channel for current sense such as 50mV Murata 3020 DMS or Riedon RSA shunts.
   b. **CS1305 Isolated Voltage Measurement**
      This pod uses a TI AMC3336 with ±1V input range to provide an individually isolated channel, for voltage sense. The CS1305 comes in 5 variants, with input ranges of ±1, 10, 100, 1000 and 2000V.
   c. **CS1306 Isolated Temperature Measurement**
      This pod uses an AD8495 K type thermocouple amplifier driving a TI AMC3336 with ±1V input range to provide an individually isolated channel to measure up to 400ºC.
2. **CS1310 CAN controller**
   The CAN controller will use an SPI CAN controller (such as Microchip MCP2515 or TI TCAN4550) to monitor or stimulate CAN messages in an automotive CAN network.

3. **CS548 Windows application upgrades**
   A new logging display will allow logging of up to 16 channels (from two connected CS548's) of Voltage, Current or Temperature using the measurement pods. Signals can be continuously streamed and saved to disk, or use triggered capture to display a time window, just as the Scope display works. The same zoom and pan controls will apply. A new signal information display will analyse measurement pod signals.
   In addition we plan a power analysis function to measure three phase power, harmonic structure, power factor, and efficiency using either high speed channels or the measurement pod channels. A three phase system would require 3 phase current pods, 3 phase voltage pods, and DC Bus voltage and current pods. This can be supported using both CS548 pods.

Analog Inputs

* Item still to be implemented. See Specification Status section.

Parameter	Specification	Notes
Number of channels	0 - 4	Fibre optic isolated from each other, local or remote channel.
Isolation Voltage - Local	2kVdc, 600VAC CAT III, 1kVAC CAT II	Supported by IEC 61010-1 Ed 3.0 and IEC 61010-2-30 (Test Equipment) 22mm creepage and 18 mm clearance, reinforced.
Isolation Voltage –Remote Channel	±30kVdc	When mounted >150mm from reference plane or other structures not at the common mode voltage. If measured signal frequency is >1 MHz, then must be mounted >1m from any other conductive structure not at the common mode voltage.
CMRR	>120 dB at 1 MHz >115dB at 10 MHz > 100 dB at 50 MHz	20dBV signal applied to coax common and earth reference 4mm socket.
ADC resolution	14 bits	
Input Ranges	±0.8V with 100uV resolution ±8Vwith 1mV resolution	Use probes to extend the range, eg 800V with 100x probe. The application automatically scales all values to compensate for probe attenuation.
DC voltage measurement accuracy	<±0.15% of range maximum.	After self calibration or calibration.
Sample Rate	500 MSPS	All Analog and Digital digitize simultaneously. Currently 4 x simultaneous channels with 16 MSamples per channel, with 2 frames = 16M x 4 x 2 = 128 Msamples
Sample Memory	500 M Samples * (installed)	4 x simultaneous channels with 16M per channel.
CM leakage to other channels	<-125dBc	20 dBV signal to CM channel, measured on other channels whole bandwidth, ±0.8V range
Channel to Channel Skew	<±144ps	Done using a 1 MHz coherent sine wave
Cross talk at 10.7 and 30 MHz	< -115 dBc	Using 1.6V p-p into the channel
RMS Channel Noise 1 M samples	~300 uV rms, ±0.8V range ~ 3mv rms, ±8V range	Inputs open
Pk-Pk Channel noise 1 M samples	1.8mVp-p for ±0.8V range 15mVp-p for ±8V range	Inputs open
Sample clock jitter	300 fs rms	
Sample clock Freq tolerance	max ±2ppm	At 25 deg C
Sample clock temp stability	max ±0.5 ppm	Over -40 to +85 deg C
Enob (rms)	11.6 bits, or 1 part in 3,300	Inputs open
Noise free bits	10.3 bits, or 1 part in 1300	Inputs open
Spectral Noise floor, no protrusions	-100 dBV -115dBV	<2MHz, 200 MHz BW, 1kHz resolution >2MHz, 200 MHz BW, 1kHz resolution
Sinad	> 64 dBc at 1 MHz >63 dBc at 10 MHz >55 dBc at 30 MHz	1 Vp-p into 50 ohms signal
HD2+3	< -80dB at 1MHz < -76 dB at 10 MHz < -71 dB at 30 MHz	1 Vp-p into 50 ohms signal
THD	< -76 dB at 1 MHz < -74 dB at 10 MHz < -67 dB at 30 MHz	1 Vp-p into 50 ohms signal
Pulse Flatness	<700uV <2mV <200mV	0.5V pulse, 500us duration, ±0.8V range 0.5V pulse, 500 us duration, ±8V range 500V pulse, 500us duration, 100x probe
Overload recovery	4ns	Recovery from 10x overload
Maximum Differential Input Voltage	±1 kV, derated above 1 MHz.	Derated at 20dB/decade
Maximum Common Mode Input Voltage	±2 kV, derated above 10 MHz.	Derated at 20dB/decade
Spectral Flatness	±0.5dB from 0 - 160 MHz -3 dB at 200 MHz	Supports 200 MHz Bandwidth
Input Resistance	1 M Ohm	DC resistance
Input Capacitance	22.0 pF	Signal Input to Signal Common
Isolation Capacitance	20pF	Channel ground to chassis

Digital Inputs

Parameter	Specification	Notes
Number of inputs	8	
Common mode transient immunity	100V/ns	
Input threshold max	2.3V rising 0.9V falling	Using CS1301 isolated probes (ISOW7844). Using CS1300 threshold programmable 0-8V.
Isolation capacitance	<5pF	To chassis ground, at 1 MHz
Isolation operating voltage	880V DC (600 VAC rms) 1130V DC	Re-inforced insulation, EN61010-1 Re-inforced insulation, CSA and IEC 60950-1
Maximum Data rate	125 Mbps	Sampled at 500 MSPS
Propagation delay	13ns typ	Compensated for within CS548
Connectors	POD1 (1..4) & POD2 (5..8)	Located on front panel, USB-type C physical connector
POD connector total output power	5V 1.5A	Current limit is total for both connectors, short circuit proof.

Signal Generator

Parameter	Specification	Notes
Output Frequency Range	DC - 65 MHz	-3dB at 65MHz on un filtered output
Outputs	Unfiltered, filtered	Unfiltered is used high slew rate signals (AWB or square wave). Filtered includes a reconstruction filter for minimum sample clock injection into the signal.
CMRR	>100 dB at 1 MHz >95 dB at 10 MHz >90 dB at 50 MHz	Limited by analog channels used for test. The Sig Gen connection reduces CMRR by about 20 dB, if direct connected to a Channel.
Common mode transient immunity	100 kV/us	For control of the output DAC
Isolation Voltage	600 VDC, 300VAC CAT II	Supported by IEC 61010-1 creepage and clearance, reinforced
Unfiltered rise/fall time	3.2ns	Full scale swing
Sine Wave Flatness	±0.2 dB +0.2 -3 dB	0 - 20 MHz filtered + unfiltered, 50 Ohm terminated 20 - 65 MHz unfiltered
DAC resolution	12 bits	
NCO Resolution	24 bits	10.7 Hz resolution at 180 MSPS
Output amplitude	±1mV to ±3.5V p-p	Programmable 1mV resolution, constrained to total range ±3.5V including offset
Output offset	0 to ±3.5V p-p	Programmable, 1 mV resolution, constrained to total range ±3.5 V including offset
Output Noise	<100uV rms	
SFDR	>84 dBc	At 10 MHz
IMD	>88 dBc	At 10 MHz
HD2+3	<-77dBc	At 10 MHz
Arb Waveform Memory	4 k Samples *	Using AD9102 - UI to be implemented still
Sample Rate	180 Msps	Programmable Sample rate 1sps - 180 Msps
Frequency list values	2k *	Frequency list output in response to trigger
Envelope can be amplitude modulated	Yes *	
Pattern Generator	Yes *	Start period, output period, stop period, pattern repeat count.
Trigger	Input from FPGA *	FPGA may trigger a pattern based on Channel Trigger or other event.

USB

Parameter	Specification	Notes
Supported Modes	USB 2.0 and USB 3.0	USB 2.0 @480 Mbit/sec and USB 3.0 at 5 Gbps
Throughput	30 MBps and 130 MBps	
Connector	USB-C	Plug is reversible. No output power.
Protection	Common mode choke + ESD diodes	Using ECMF04-4HSWM10
Indicators	USB on and correctly connected	Power of signal is indicated by LED off.

Ethernet *

Parameter	Specification	Notes
Connection method	Small Form factor Pluggable module (SFP)	An SFP socket is provided for use with an SFP module. Either an optical or a copper connected SFP module will be supplied based on the order. SFP socket supplies 3.3V 150mA for module. No PoE available.
Wired Supported Modes	Ethernet 10/100/1000 *	Using an RJ45 Ethernet socket connected copper SFP module. Transformer based isolation.  Software being implemented
Optical supported mode	Ethernet 1000BASE-LX *	Gigabit (1G) Ethernet using an LC fibre cable connected optical module. Full optical isolation.  Software being implemented
Throughput	12 MBps and 120 MBps	
Connector	SFP Socket	Small Form Factor Pluggable socket
Indicators	Ethernet on and correctly connected	Power of signal is indicated by LED off.

Power Supply

Parameter	Specification	Notes
Input Voltage Range	10-24 DC	Over voltage protected
Power consumption	43W	
Connector	Barrel Socket, 2.5mm I.D. x 5.5mm O.D	Connection is reverse polarity protected.
Protection	Clamped to +68V Clamped to -32V Operates with 35V Survives with 5V	ISO16750 pulse A (79 ohm 0.5 ohm) ISO7637 Pulse 1 (-600V, 50 ohm) FPGA operation at 5V, ADC operational at 7V.
Indicators	Power On, Channel Status	Software controlled.
Power Adaptor	VEC65US19	100-240VAC input, 19VDC 65W output.

Digital Port *

The Digital Port is based on a programmable logic IC, and can be used for generating complex state based sequences or reacting to a complex set of inputs. The port includes triggering capability. The UI has not been completed.

Parameter	Specification	Notes
Input/Outputs	16	Programmable as In or Out
Logic Level	Programmable 1.8 - 5V	All I/O operate at the same logic level
Control IC	SilegoSLG46826V	User configurable programmable logic with analog functions
Resources	19Multi-function Macrocells Prog Oscillator, 25MHz, 2MHz, and 2 kHz. 256x8 EEPROM 4 Analog Comparators 2 x Deglitch filters Two voltage references I2C port	2-4 bit for complex logic All resources can be arbitrarily connected as required.
Programming	Silego GP Designer	Visual schematic designer of circuit functions downloaded into CS548
Trigger In/Out	Bidirectional Trigger	For interaction with measurement system.
Protection		Over voltage protection to +12V and -6V
Connector	WE 61202021721	20 pin 0.1” double row
Output power	Variable 2.5-5.0V, 1A	Short circuit proof.

Link Port *

The Link Port is used for controlling Cleverscope accessory devices such as the CS1070 1A 50 MHz power amplifier, and the CS1110 V_{CE} Sat Probe. It also includes RS232, SPI and I^2C ports for controlling user equipment.

Parameter	Specification	Notes
Digital Port Use	2 Digital In, 4 Digital Out	Used for accessory control
I2C Port	400 pbps port	For control of user devices
SPI Port	1 MHz SPI Port	For control of user device, mutually exclusive with RS232 Port
RS232/RS422 Port	3V level RS232 port, or differential RS422 port, programmable baud rate	For control of user device, mutually exclusive with SPI Port
Trigger Port	Trigger In/Out and control	
Protection		Over voltage and reverse voltage protection using ESD devices
Connector	Mini Din 8	
Output Power	5V 1.5A (current limited)	Pin 1 = 5V, Pin 2 = GND.

Link In/Out Port

The Link In/Out Port is used daisy chaining 2,3 or 4 x CS548 Cleverscopes together.

Parameter	Specification	Notes
Clock ports	Reference clock, 500 kHz	The first CS548 in the chain provides the 500 kHz reference clock that is used for simultaneous sampling by all units.
Trigger Ports	Trigger transfer	The Trigger Ports transfer the trigger to other units.
Control Ports	Control signals	The control signals are used to signal readiness to trigger, and sampling state.
Connectors	HDMI	Use with 500mm linking cable supplied by Cleverscope. Not for use with longer cables.
Output Power	5V 1.5A (current limited)	Only available on LINK OUT.

See the selected measurements section for an example 8 channel display.

Probe Compensator Output

The probe Compensator output is used to compensate the probe response for time domain flatness.

Parameter	Specification	Notes
Signal	1 kHz Square Wave	Variable 50mHz to 58.3 Mhz
Duty Cycle	50%	Variable with 3.32ns resolution to 10s high.
Amplitude	Programmable 5-12V	150mA current limit
Rise/ Fall Time	~ 1ns	

Connection	BNC, 50 Ohm source	Designed for 10x probe. 10mV dip with 50 Ohm load.

Environmental

Parameter	Specification	Notes
Temperature	0°C to +40°C -20°C to +60°C	Operating Storage
Cooling Method	Fan Assisted	
Humidity	0°C to +40°C >40°C	<90% relative humidity <60% relative humidity
Altitude	<3,000m 15,000m	Operating Non-operating

Mechanical

Parameter	Specification	Notes
Size	Height 69 mm Width 187 mm Length 300 mm	Including feet Including connectors
Weight (approx)	2.6 kg 4.1 kg	Acquisition Unit only Complete in display box
Material	Anodized Aluminium	

Specification Status

The CS548 is FPGA based, and upgradeable in the field. The customer can use Cleverscope Rom Loader to download new firmware and logicware to improve or add functions to the unit. The hardware system for the CS548 has been thoroughly tested to meet the specifications above, and includes all the resources needed to meet the full specification. However, some software functions are still to be added. As these are added, updates are placed on our website for download at no cost. Cleverscope has used this method for years to add features such as FRA, streaming, complex maths etc. Should the current specification set meet your needs, you are able to use the CS548 now, and upgrade, at no cost, as further functionality becomes available.

Implemented in newer versions:

Feature	Specification	Note
Sampling Rate	500 MSPS	Implemented for units using an AD960 ADC (Serial numbers IW10210 and later). Not for CS448.
Sample Memory	128M Samples.	Organized as two 16M frames per channel for 4 concurrent channels (2 x 16M x 4 samples = 128M).
Multi unit Linking	Up to four units can be linked via Link In and Link Out Ports	See page 8 Multi Unit Linking. Currently only CS548.

Key features that still have to be implemented are:

Feature	Specification	Note
I/O Interfaces	Ethernet is supported*	Ethernet is currently not supported. We have implemented a hardware based IP stack, which is functional. Integration is proceeding with the CS548 firmware.
Signal Generator Waveforms	The signal generator will support AWB	The isolated Signal Generator currently only supports Sine and variable duty cycle Square wave generation and sweeping. The hardware (based on the AD9102) can generate 4K Arbitrary Waveforms, and patterns. The sig gen design includes a swept clock source to allow sweeping arbitrary waveforms (including square and triangle waves). The user interface for this is not yet done.
Link Port	The Link includes SPI, UART and I2C generation	The Link Port includes the facilities to generate I2C, Uart and SPI messages, as well as digital outputs. This capability is already supported by the firmware and DLL driver. However a UI has not been implemented in the application. This will be done as time permits. The Link Port is used with I2C for CS1124 and CS1133 expansion.
Faster Peak Capture	Replay Peak Capture to run at close to real time	The current system has real time peak capture where the decimator outputs samples at below the maximum sample rate (eg Streaming). However, the replay peak capture system, while working, is not optimized and relatively slow. A DMA/Hardware based system will be used for peak capture replay.
Digital Port	Full use of SilegoSLG46826V	Hardware has been tested. The Silego programmer can be used. The CS548 will provide Silego design download at some point.

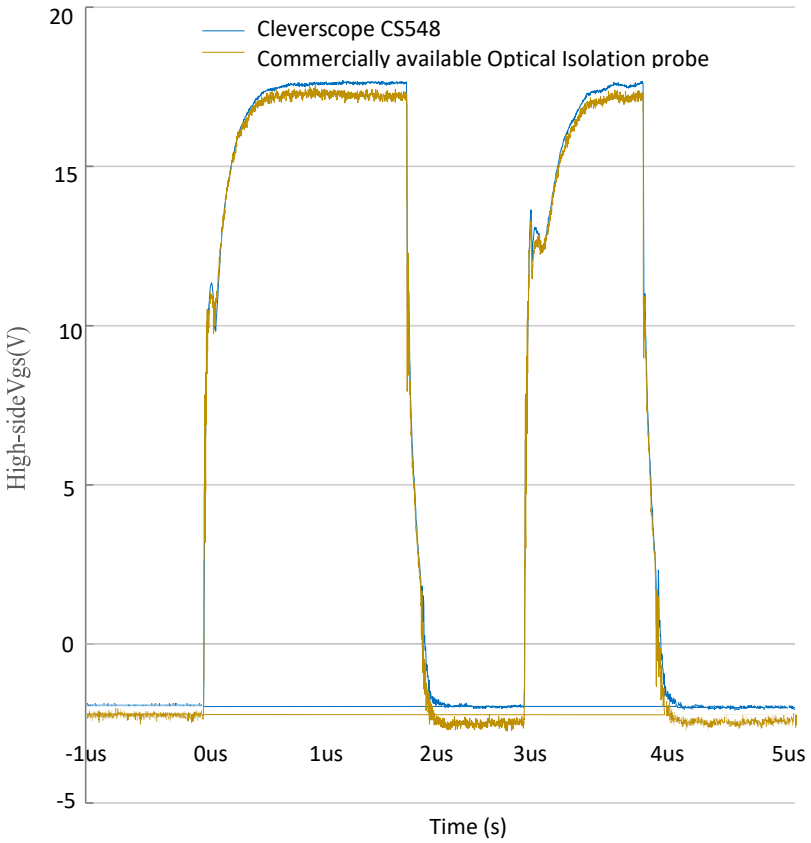
Where a feature has not been implemented yet, it includes an asterisk in the table above.

Selected Measurements

In this section we show some of the measurements that define the unique aspects of the CS548.

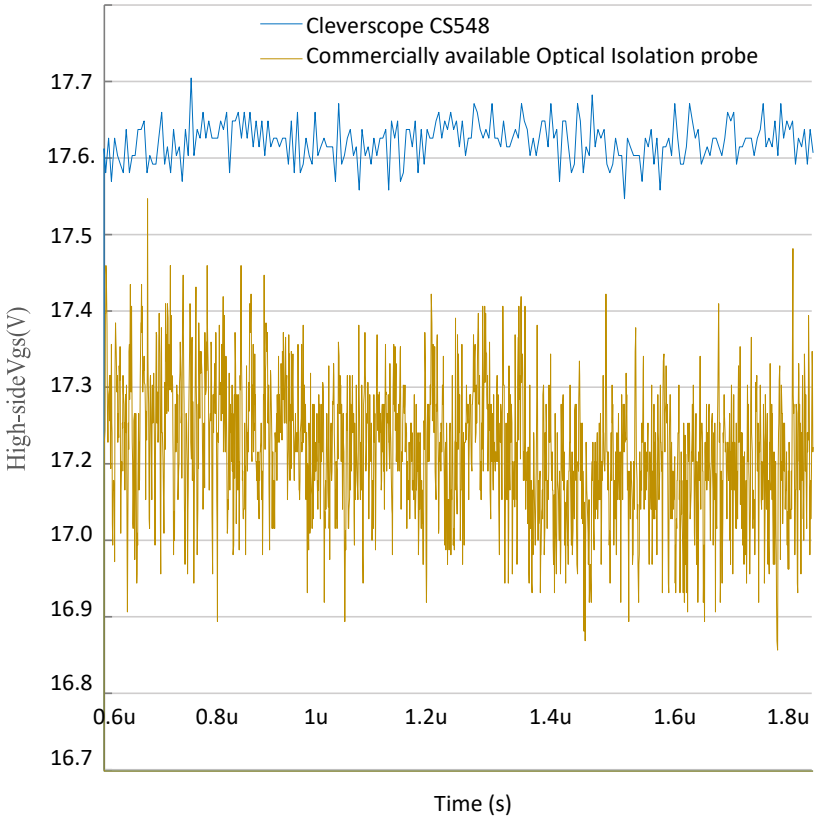
Below are comparison measurements between a Cleverscope CS548 and a commercially available Optical Isolation probe. These double pulse measurements were taken by a third party Oscilloscope manufacturer.

High Side Measurements of a Gate Drive



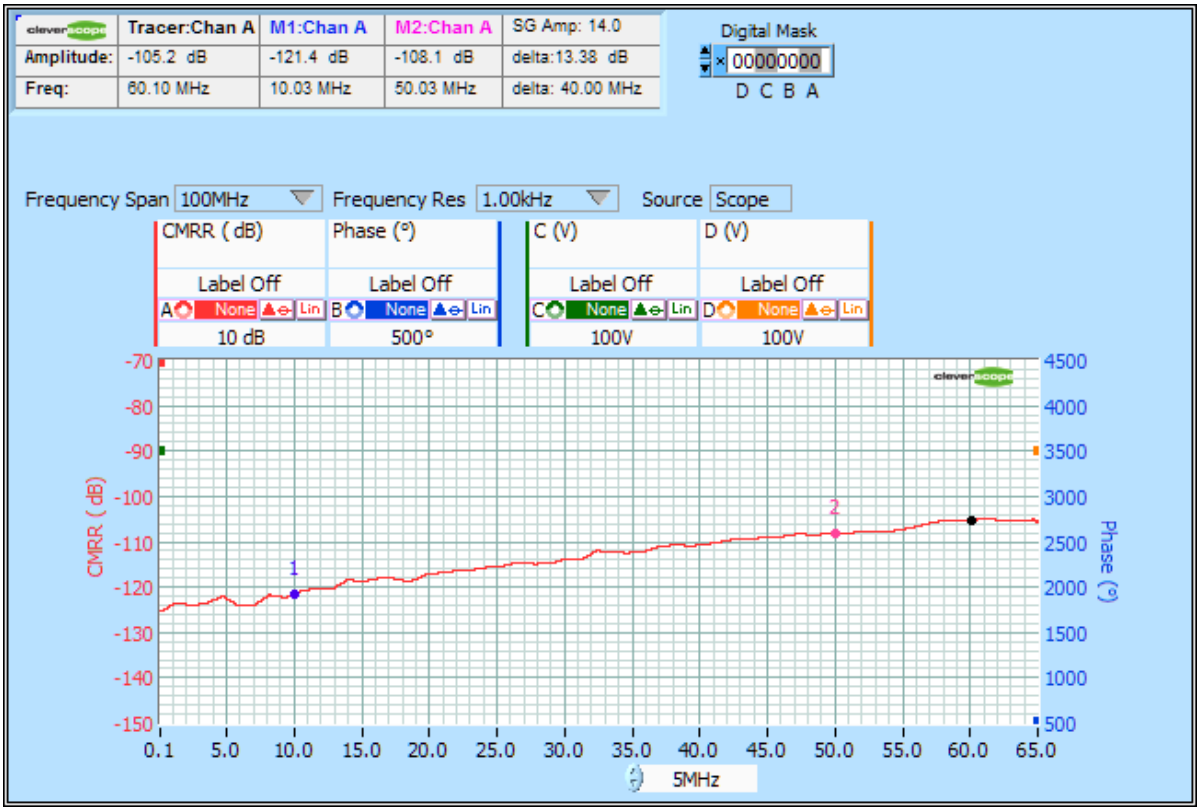
These graphs are showing the superior noise performance of the CS548 when compared with a commercially available optical isolation probe. The CS548 is using an 80V range to measure the 17V gate drive. The commercially available probe is using the most optimum voltage range and tip.

Note the increased noise of the commercially available Optical Isolation probe, expanded first pulse:



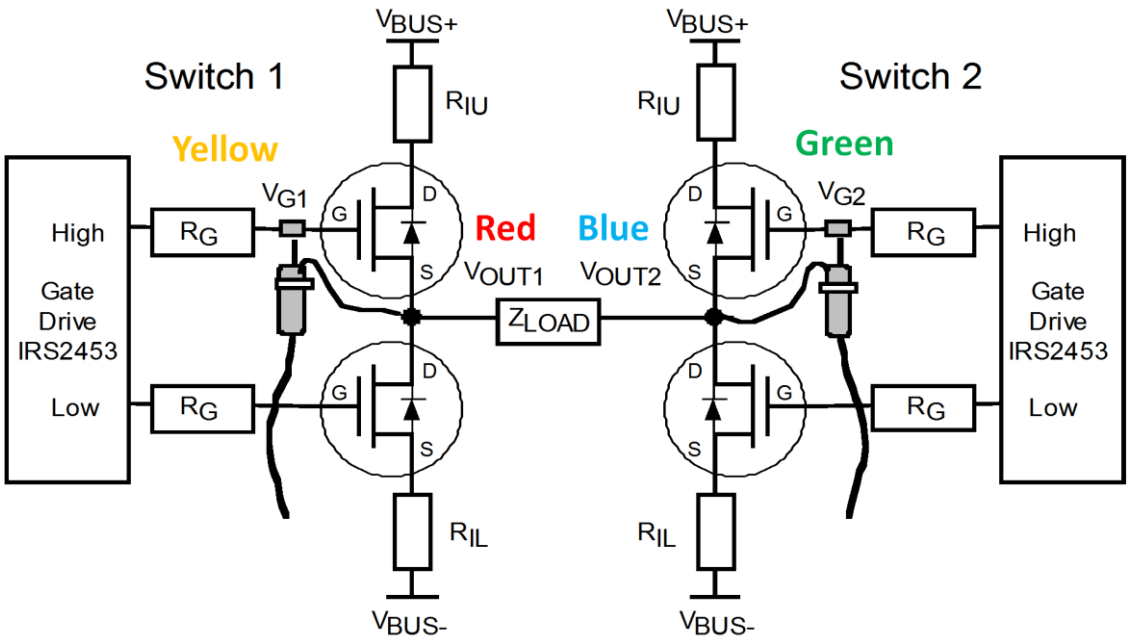
Common Mode Rejection

Typical channel CMRR is shown below:.

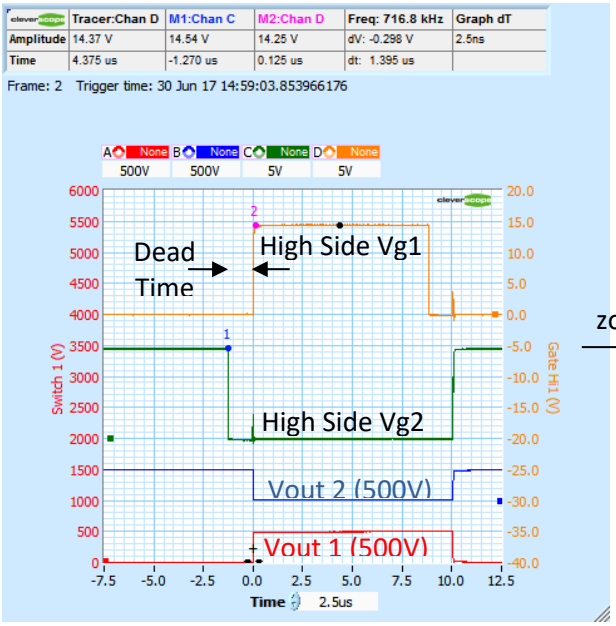


Application in switching Power Bridge

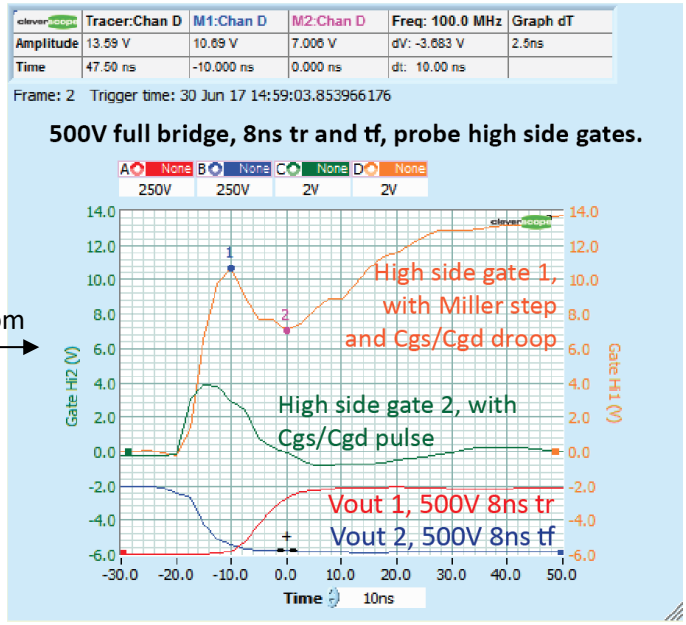
Using this full bridge setup, which swings 500V in 8ns:



We measure these results:



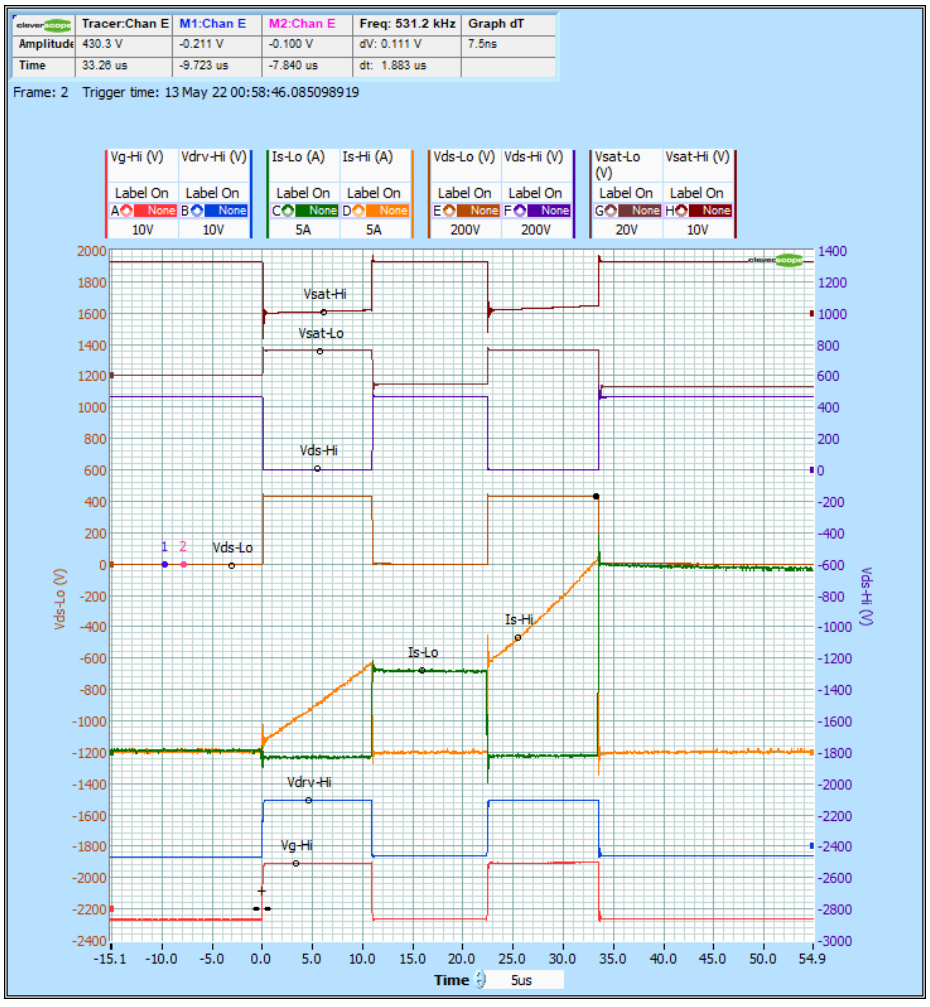
zoom



The high CMRR, and the isolation allow the high side gate drives to be measured without large common mode artifacts. We can observe dead time, pulse timing, the gate charge characteristic, and parasitics such as the Cgs/Cgd droop and pulse effects.

Measurements of a double pulse high side transistor with 8 channels

Two units can be connected together using the Link Out port connected to the Link In port with the CS1021 500mm link cable. Here are two gates, two gate drives, and two Switch nodes on the full bridge:



Zoom in on the PDF to examine the detail.

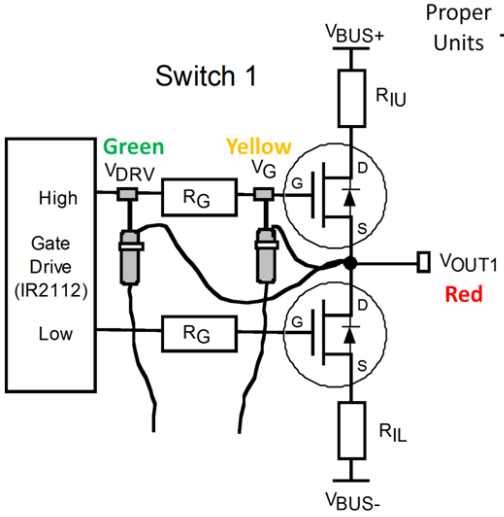
The current is rising in the load inductor during Pulse 1, we can examine the top transistor turn off and then turn on, and the rise in inductor current during Pulse 2. We can measure the conduction Power during the two pulses, and switching Power during turn off ad turn on.

Channels are:

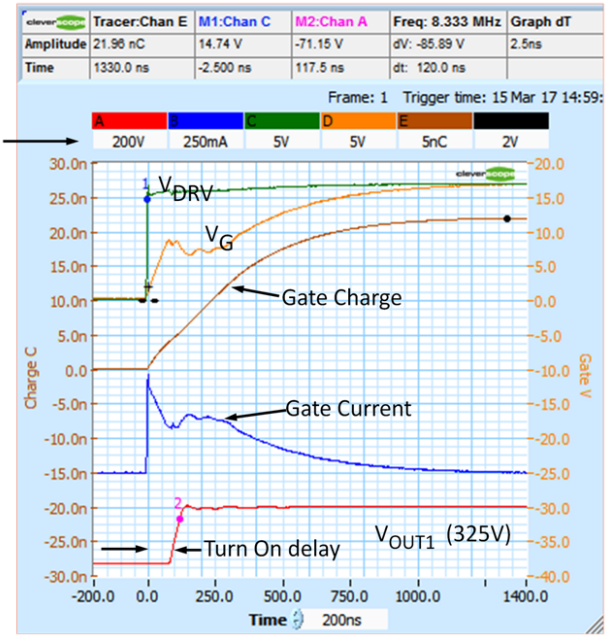
- Vsat Hi
- Vsat Lo
- Vds Hi
- Vds Lo
- Is hi
- Is lo
- Vdrv Hi
- Vg hi

Measuring Gate Charge in a SEW Movitrac Variable Speed Drive (VSD)

Measuring Gate Drive System
Example: SEW Movitrac



Proper Units →



Calculate Charge

$$Qg = \int Ig\ dt$$

Total Gate Charge
Qg = 22nC

Calculate Current

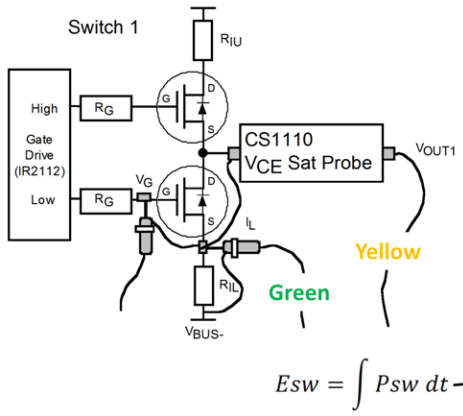
$$Ig = \frac{V_G - V_{DRV}}{RG}$$

Plateau gate current
Ig= 400mA

The high CMRR, and isolation allow making differential measurements across the gate drive resistor, even though it is swinging 325V in 37ns. Maths is used to calculate the gate current which is then integrated to calculate charge.

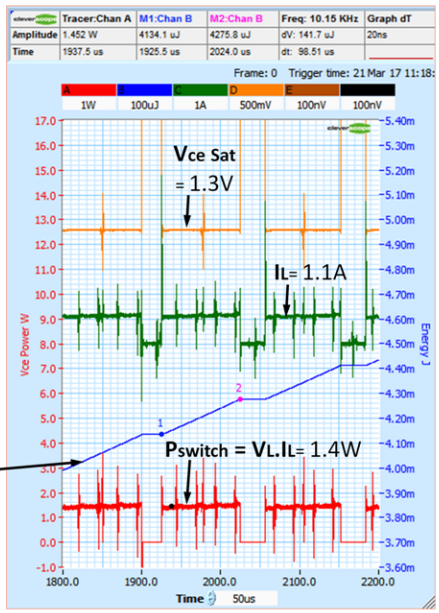
Measuring Conduction Power in a SEW Movitrac VSD

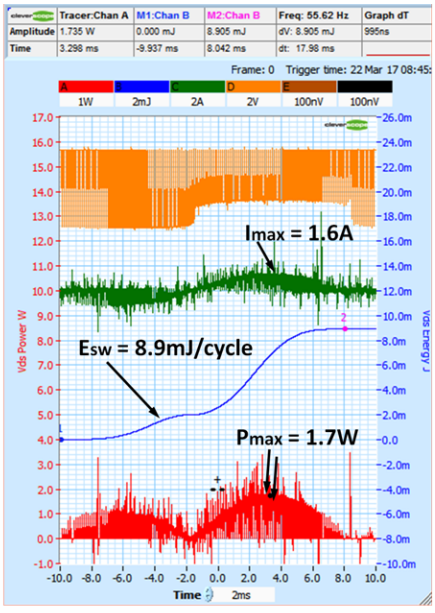
We use a Cleverscope V_{CE} Satprobe to accurately measure small voltages while exposed to large (<1000V) voltage swings.



$$Esw = \int Psw\ dt$$

Use a CS1110 $V_{CE\ SAT}$ probe to measure conduction peak, and averaged power loss.



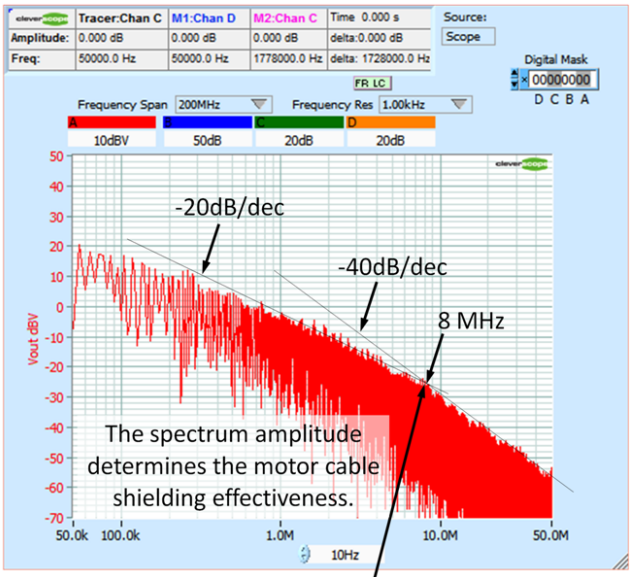


Esw/sec = 55 (Hz) x 8.9 = 494 mJ/s.
Average power = 494mW

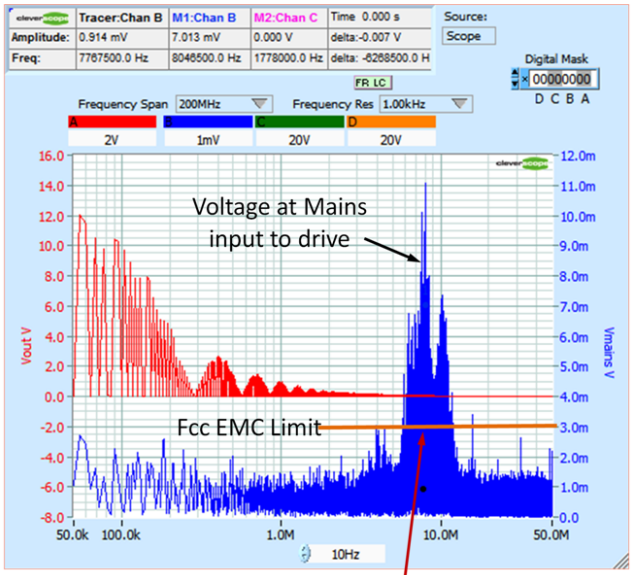
We use Maths to calculate the conduction current (green), the V_{CE} Satprobe to measure the switch saturation voltage (Yellow), the instantaneous power (red) and the energy per cycle (blue) to calculate the average conduction Powerpower (494 mW).

Measuring required shielding performance and EMC filtering effectiveness

We us 100x probes to measure the Switch voltage, and the input mains voltage safely.



The 20/40 dB/dec corner frequency is set by the rise time (F = 1/π 37ns). A slower rise time reduces how good the shield needs to be.

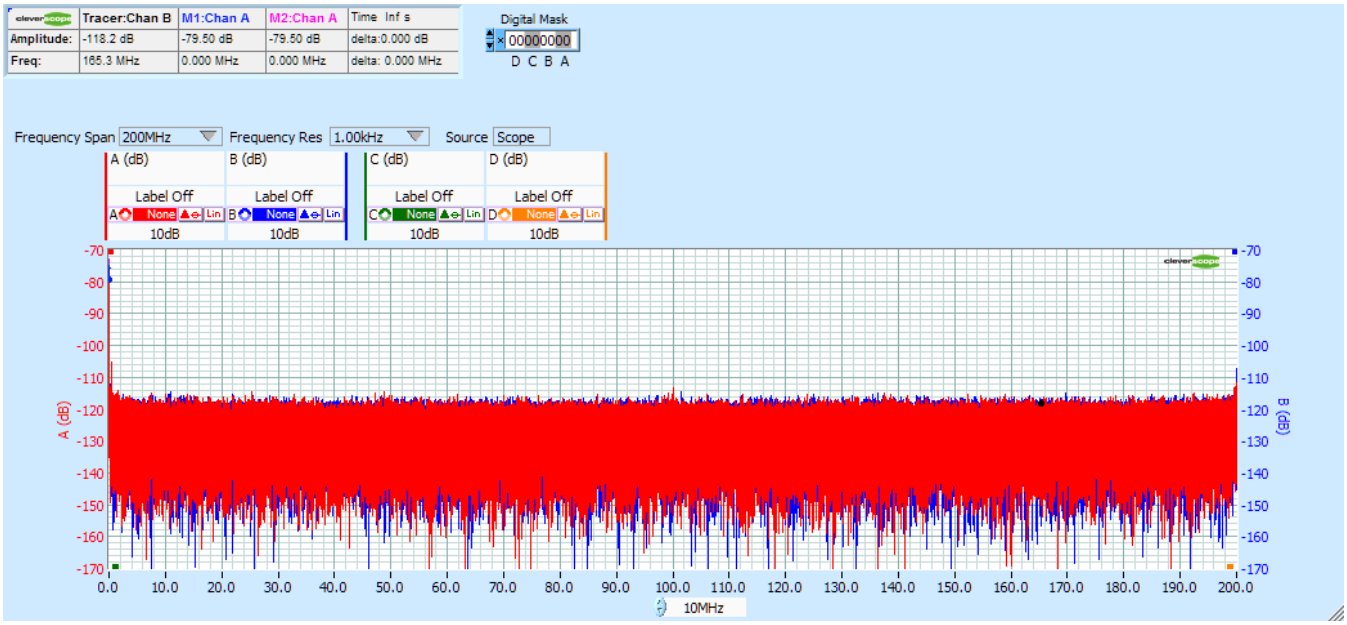


The mains input is not sufficiently filtered, and the drive does not meet the FCC standard. A slower rise time would help, and improved filtering.

This test uses the Spectrum Analyser.

Spectral Noise Floor

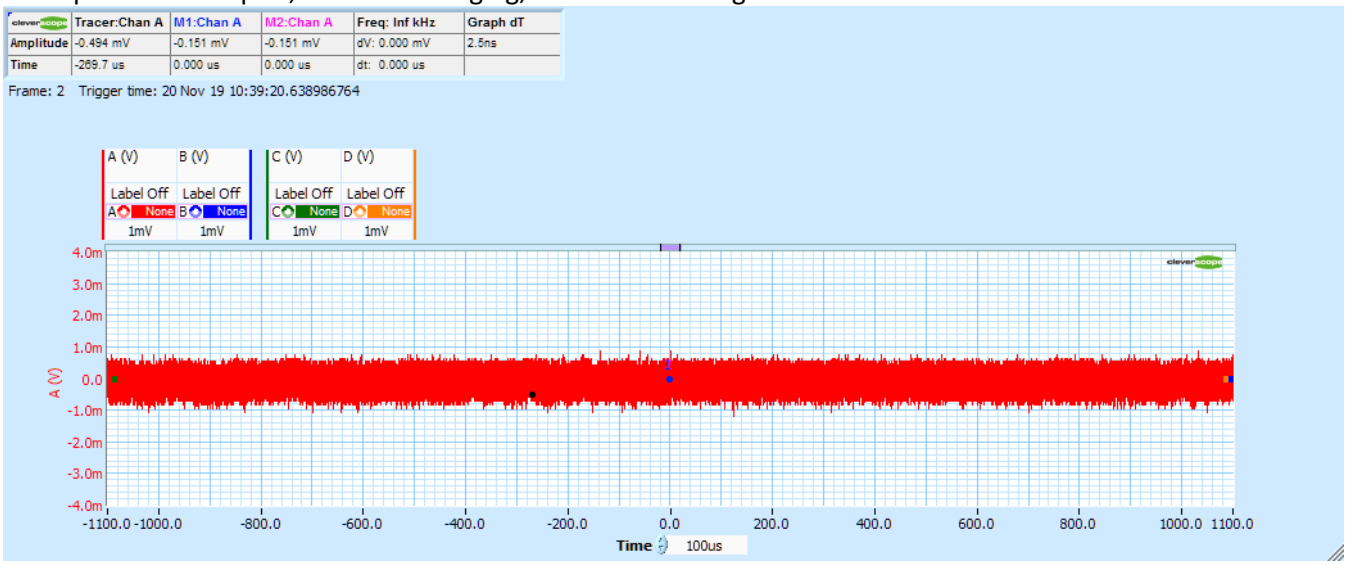
This is the full bandwidth noise with all four channels being captured with open inputs, 1kHz resolution, in dBV:



The noise floor is uniform, and below about -115 dBV per bin.

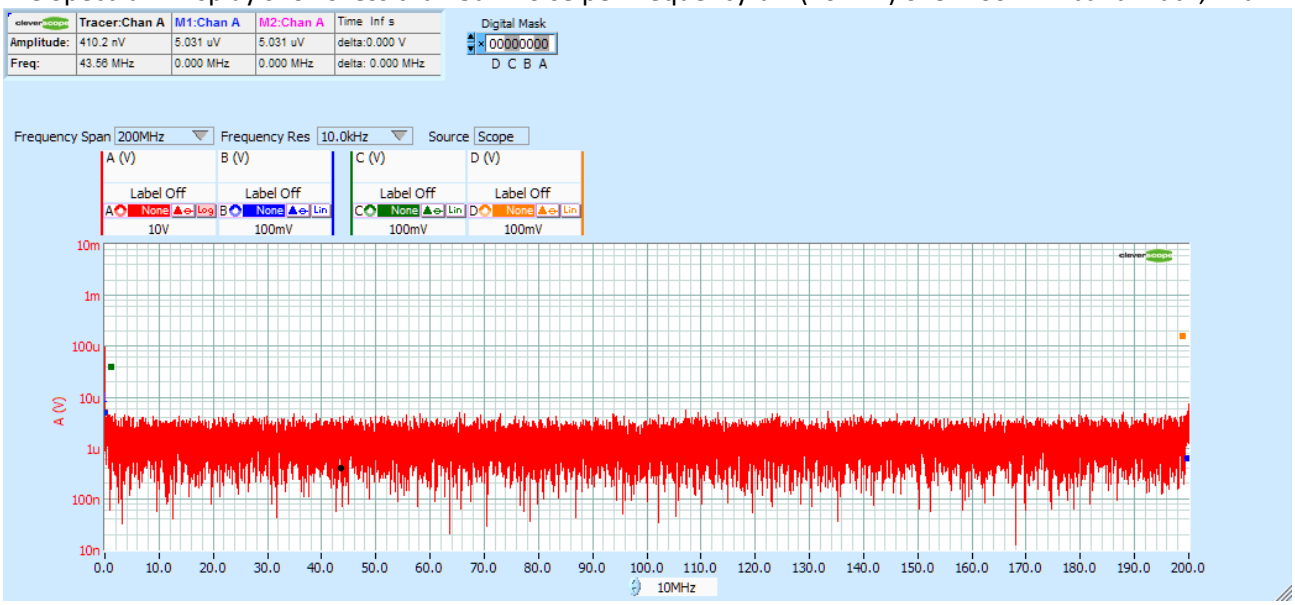
Time Noise Floor

We capture 1M samples, without averaging, on the ±0.8V range:

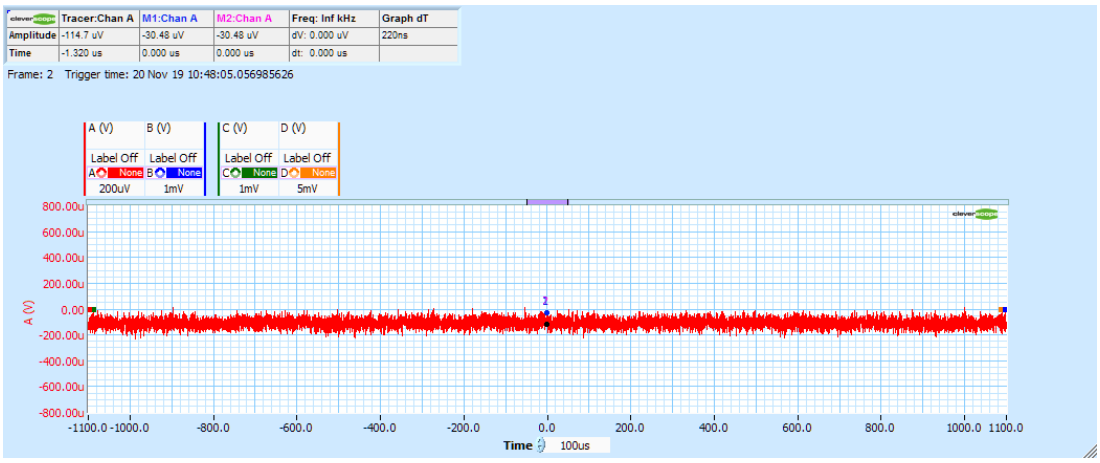


We use the signal information display to calculate the Standard Deviation (a good estimate of RMS, less the DC) and the peak to peak. We see about 200uVrms noise, and less than 1.8mV p-p noise.

The Spectrum Display shows less than 8uV noise per frequency bin (10 kHz) over 200MHz bandwidth, in uV:

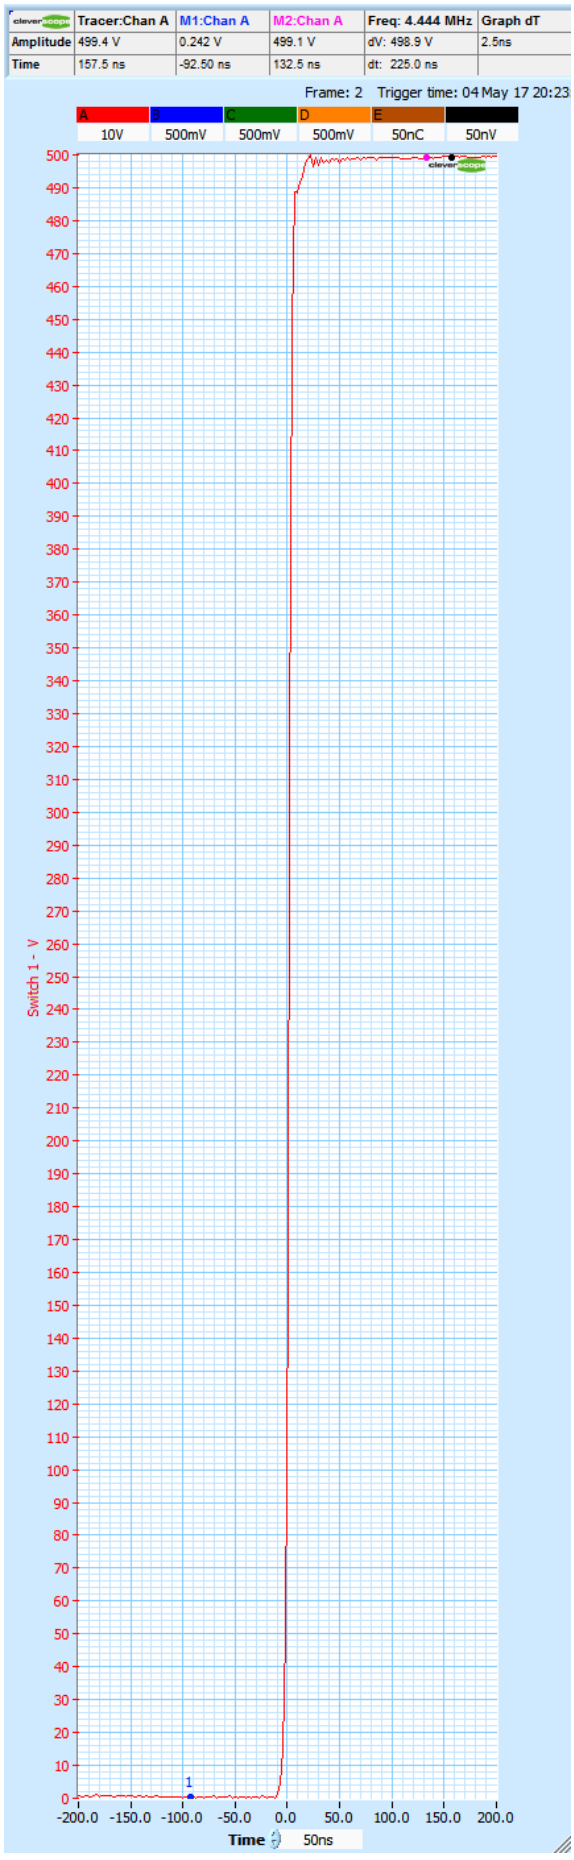


Averaging, and the moving average filter can be used to improve the noise floor to around 200uV p-p :

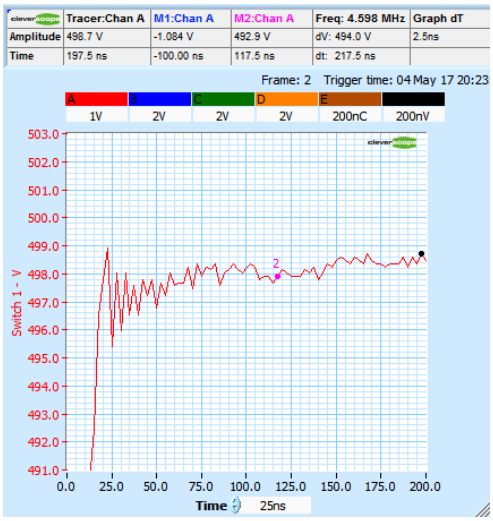


Response to 500V 10ns transition

We measure the CS1090 Switch 1 output (500V, 10ns rise time):



This trace shows the transition measured using a 100x probe. The display pixel resolution masks the actual channel resolution, shown here at 1V/div:



This kind of resolution is not possible with an 8 bit scope.

Frequency Response Analysis Functions (FRA)

The Frequency Response Analysis (FRA) system uses the isolated signal generator to provide stimulus for component, system or power supply measurements. The measurements available are shown in the Displays/FRA section of the data sheet. Here are a collection of measurements made using the FRA system (zoom on the PDF to see the detail):

Impedance of a ceramic capacitor

Cleverscope Application Specification

Calibration

Calibration method	Automatic self calibration
Calibration Voltage Source (Internal)	2.5V reference, 40 ppm stability (1000 Hrs) , 30 ppm/deg C
Calibration Voltage Source (external)	7.5V reference, 20 ppm stability, ±0.035% accuracy, 7 ppm/deg Cusing ISL21090-7.5

Displays

Windows	Simultaneous Capture, Tracking, Spectrum, Information, Maths, XY, Control Panel, Streaming, Frequency Response Analysis (FRA), Pulse Builder and Protocol setup windows
Scope window functions	Defines capture specification for signal acquisition unit, defining amount of time before trigger, amount of time after the trigger, lower amplitude limit, upper amplitude limit. Defines Tracking graph time position, when tracking graph is linked. Defines trigger level and direction Full zoom and Pan in both axis. Annotations. Custom units Custom colours
Tracking window functions	Displays zoomed section of captured signal. Resolution from 1ns to 5s/div. Full zoom and Pan in both axis. Annotations. Custom colours
Spectrum window functions	Display spectrum of signal captured in capture window. User definable resolution Full zoom and Pan in both axis. Annotations. Custom units Custom colours
Maths window function	Displays results of Maths equations. Maths equations are user entered expressions involving any of the inputs (analog and digital), previous maths equation line results, and an arbitrary number of function results (+ - * / sqrt, power, log, ln, all transcendental functions, equality functions). Custom units. Provide live Matlab link.
XY window function	Displays XY graph from source (Capture, tracking, spectrum, or Maths
Information window functions	Displays automated measurements (see below) Used to log derived information values to disk, with a period of between 0.05 – 86,400 secs per sample. Live logging to Excel DDE live value transfer to Excel.
Control window functions	Provides Trigger settings – analog and digital Provides Sample control – single, triggered or automatic. Provides access to tools – Pan, Zoom, Annotate Controls Frame store Controls Spectrum resolution, acquisition method and averaging
Frequency Response Analysis (FRA)	FRA control panel is used to setup up oscilloscope/signal generator to make automated measurements of these values vs frequency: • RMS Amplitude • Power • Power Density • Gain/Phase • Impedance + R_{ESR} or Q/D Factor or Phase • Capacitance + R_{ESR} or D Factor or Phase • Inductance + R_{ESR} or Q Factor or Phase • Shunt Impedance (magnitude without phase for low impedances) • PSU Gain/Phase - for finding Gain/Phase of powered up power supplies • PSU PSRR - for finding PSRR of powered up power supplies • PSU Output Impedance - for finding Output Impedance of powered up power supplies • PSU Input Impedance - for finding Input Impedance of powered up power supplies

	• Probe calibration functions for maximum accuracy.
Protocol Setup	Provides protocol setup for I2C, SPI , UART and parallel bus.
Pulse Builder	Allows manual control of isolated digital outputs state, Pulse Builder for pulse trains, PWM with up to 4 PWM generators, including single output, half bridge, or full bridge, and double pulse test for high side and low side.

Measurements

Cursors	Voltage Difference between cursors Time difference between cursors Reciprocal of ΔT in Hertz (1/ΔT).
Automated measurements	**Function**: DC, RMS, Max, Min, Pk-Pk, Std Dev, Period, Fundamental Frequency, Fundamental Peak amp, Pulse Length, Duty Cycle **Function**: 0 -> 1 Time, 1 -> 0 Time, V '1', V '0', V swing, Overshoot, Slew rate, Pulse Period, Pulse Frequency, Pulse Length, Duty Cycle **Function**: DC, RMS, Fsignal, Vsignal, F1, V1, F2, V2, F3, V3, SINAD, THD, HD2+3 **Function**: A at F, B at F, A max, A min, B max, B min, Amax at 0 B, Amin at 0 B, Bmax at 0 A, Bmin at 0 A, A -3dB L: H, B -3dB L: H
Custom units	6 characters
Custom signal names	20 characters
Custom scaling	Scale + offset by defining two (Vin,Vout) points
User definable colours	Signals, Background, Major Grid, Minor Grid

Mathematical Functions

Functions over the signal	Differentiation, Integration, Filtering, Power functions, Matlab interface, Signal Processing functions
Functions on a data point	Addition, subtraction, multiplication, division, squaring, square root, (inverse) sine, cosine, tangent, tangent, log, sign etc. Equality operations.
Maximum number of sequential mathematical equations	10, symbolic with multiple operators and operands.

Spectrum Analysis

FrequencyRange	User definable, Range = 0- 1/Scope Graph ΔT Frequency axis – log or linear.
Analysis Output	RMS Amplitude, Power, Power Density, Gain/Phase
Frequency Resolution	In 1, 2, 2.5, 5 sequence with 1 part in 1M resolution.
Output type	Volts, Power, Gain/Phase in linear , dB, degree or radian values. Impedance, LCR, Q and DF. Custom units can be applied.
Window types	None, Hanning, Hamming, Blackman-Harris, Flat top, Low Sidelobe
Averaging	Moving average, block average, peak hold.
Averaging method	Vector averaging in time domain if triggered. RMS averaging in frequency domain if not triggered.

Protocol Decode

Protocols	I2C, SPI , UART and parallel bus.
Protocol decode inputs	Digital Inputs 1-8, External trigger, Channels A, B User defined threshold when using analog inputs
Protocol decode variables	Number of bits, Clock edge rising or falling, Bit invert/non Invert, Select Hi/Lo, MSB first or not, Number of stop bits.
Output display type	Naming label. Character, Hexadecimal or Decimal Number. Colour.

Streaming

Sampling Rate	12 SPS – 3 MSPS (Streaming rate will be improved in the future)
Sample preparation	Peak capture or Filter prior to decimation. Using 10MHz filter with 14 bit ADC we achieve 13 bits ENOB at 3 MSPS (60uV noise floor with +/-0.8V range).
Sample storage	Up to 500 G samples. Samples are stored in multiple smaller files to increase speed.
Review capabilities	Zoom and pan anywhere in sample space. Samples are displayed peak captured (ie 1us pulse will still be visible in 1 day long sample record).
Export capabilities	Export tab delimited text, binary, or Cleverscope format file. Output between markers, or current display. Set output depth.

Data Export

File types output	Cleverscope proprietary, Tab delimited text (Excel compatible), Excel file (for signal information logging), binary (format given in help).
Live Data output	DDE to Excel, direct placement of data into live Excel sheet Live data output to and return from Matlab

Windows facilities

Standard Functions	Copy and Paste Save and Open native format (saves full setup) Save and Open tab delimited text file Save and Open binary file (start time, dt, data) Print with Date/Time, File Name and Description. Print Setup
Windows	Dynamically resized Can be placed anywhere on desktop Can be docked to move with Cleverscope Control Panel Can be docked to minimize/restore with one click.
User defined units	6 characters
User defined signal names	20 characters
User defined scaling	Scale + offset by defining two (Vin,Vout) points
User definable colours	Signals, Background, Major Grid, Minor Grid

Document changes:

5 May 2017 v1.1	- Original
12 July 2018 v1.2	- Added Specification Status section.
20 Nov 2019 v1.3	- Added 8 channel display
16 May 2022 v1.0	- for CS548 specification.
8 July 2022 v1.2	- Addition of CS1133 and CS1233. Minor changes to CS548 Specification.
10 Feb 2023 v1.3	- CS5X8 Options
22 Feb 2023 v1.4	-Added other system items and new photos
18 Aug 2023 v1.5	- Add 'Warning' section.
31 Mar 2024 v1.6	-Change Measurement pod section
19 June 2024 v1.7	- Add Power Ratings on all connectors
25 June 2024 v1.71	- Fix Measurement Category: 1000VAC CAT II (CHA..D) and 300VAC CAT II (Sig Gen).
12 Aug 2024 v1.81	- Update Front/Back Images, Add warnings: to be powered by a limited energy source.
31 Aug 2024 v1.9	- Merge v1.62 & v1.81. Remove CS1092. Add CS1201 & CS1097.
5 Jan 2025 v1.92	- Add 4 unit explanation. Tidied up the CS1097 section.
5 May 2025 v1.94	- Updated DPT capture picture
16 Dec 2025 v1.95	- Updated some spec value.
30 Mar 2026 v1.96	- Added CS1203 description
9 June 2026 v1.97	- Added CS1202 description
8 June 2026 v1.98	- Changed Digitizer to Channel naming
